Current Zone Pavement condition index (PCI)

5 Year Post Rehabilitation Zone PCI: \$2.54M Annual Budget

1.0 EXECUTIVE SUMMARY

1.1 Project and Methods Overview

In July of 2025, IMS Infrastructure Management Services, LP (IMS) utilized a cutting-edge Integrated Road Information System (IRISpro Pave) (**Figure 1**) to capture continuous, high-resolution pavement images that were used to assess pavement cracking, rutting, and roughness on 126 centerline miles (29,192,577 SF divided into 1,528 streets or approximately 159 survey miles) of predominantly asphalt roadways in Santee, CA (City). IMS followed the American Society for Testing and Materials (ASTM) D6433 standard to analyze the images and distress data collected by the IRISpro to determine the Pavement Condition Index (PCI) for each segment of the road. PCI values were recorded to provide an indication of the surface conditions and structural integrity of a pavement.

Using the Easy Street Analysis (ESA) pavement management system, IMS developed multi-year pavement maintenance and rehabilitation (M&R) recommendations for the roadways surveyed. The recommendations consider the severity, quantity, and type of pavement distresses, surface type, pavement strength and functional class. By utilizing these recommendations, the City can make informed decisions on how best to allocate their resources to ensure the longevity and safety of their roadways.

Figure 1 - IMS Integrated Road Information System platform (IRISpro Pave)

The PCI method was used in accordance with the ASTM D6433 standards to assess the condition of the City's pavements. This method is considered an objective and repeatable approach to assess pavement condition, which is preferable to alternative methods that rely upon potentially biased human ratings. Based on the PCI results, ESA prioritizes funding using a cost-of-deferral approach, recommending M&R activities that optimize funding by selecting rehabilitation candidates only when they approach the critical point where a heavier maintenance activity will soon be needed to restore the roadway to full service.

The analysis and data presented in this report are based on the inspections performed by IMS in July of 2025 on the City's pavement network, using available work history and other assumptions that are elaborated on later in this report. Roadways that were rehabilitated or reconstructed after the field inspection was performed were assigned a PCI value of 88-100 depending on the treatment. All other segments were deteriorated using the defined pavement deterioration models to reflect the conditions of the roadways at the time of analysis, July of 2026.

1.2 Results Overview and Recommendations

PCI values provide an indication of the surface conditions and structural integrity of a pavement. The 0–100 (Very Poor – Excellent) PCI range is commonly divided into categories using descriptive terms: *Very Poor*, *Poor*, *Marginal*, *Fair*, *Good*, *Very Good*, and *Excellent*. Divisions between the terms are not fixed but are meant to reflect common perceptions of pavement conditions. These divisions are discussed in more detail in Section 3.0.

The City's overall street network was generally found to be in Good condition with an average **PCI of 69**. **Figure 2** provides a visual breakdown of the distribution of pavement area across different PCI categories at the time of analysis. Approximately 57% of the City's roadways were found to be in Excellent or Very Good condition. If structurally sound, these pavements are often suitable candidates for cost-effective preventive maintenance treatments. On the other hand, pavements with a PCI below 40 (i.e., pavements in Poor or Very Poor condition) comprise the City's "backlog" of M&R. The City's backlog was found to be 11%. These pavements typically require full or partial reconstruction. Pavements falling within the middle categories, such as Fair or Marginal condition, often benefit from overlay projects. It's important to note that these are general recommendations, and the specific M&R strategy may vary based on factors such as distress types, soil conditions, structural adequacy, and other project-specific details.

Figure 2 - Distribution of the City's Pavement System on a Condition Scale

Metrics of Health

The following three metrics are frequently used as indicators of overall pavement network health. The pavement analysis uses these metrics as benchmarks when determining budget goals, such as the backlog control, PCI control, and recommended funding levels.

Pavement Condition Index (PCI) – The PCI score is a ranking assessment on the overall health of a pavement segment on a scale of 0 to 100 where 0 is considered the worst and 100 the best. This factor can be given a higher weight to give greater priority to poor condition streets. The network average PCI is a good global indicator of a network's overall health.

Percent of Excellent Roads – Roads with a condition category of Excellent are those that score between a PCI of 85 to 100.

Backlog –Backlog is the Very Poor and Poor roads (between a PCI of 0 and 40) that represent a portion of the network in need of extensive rehabilitation such as full and partial reconstruction. Using sound pavement management and finance principles, a very healthy network will have a backlog of 10% or less.

The City met all three of the metrics for evaluating the quality of its roadway network.

- ✓ The network average pavement condition score exceeds the national average currently seen by IMS of 60 to 65, with the **City's average PCI 69**.
- ✓ The number of streets rated Excellent is above the minimum recommended target of 15% at 19%
- ✓ The backlog amount is below the maximum recommended target of 12% at 11%

The analysis conducted by IMS using the ESA pavement management system has provided the City with valuable insights into the condition of its roadways. To assess the effect of annual budget on PCI over a five-year period, **Figure 3** has been generated to depict the anticipated PCI in five years relative to different annual budget allocations. The blue line allows the user to assess the effect of a given annual budget on the PCI in five years, serving as a valuable tool for understanding the potential effects of budget decisions on future pavement conditions.

Figure 3 - PCI Based on Five-Year Annual Budget Funding Models

It is important to note that the information presented in the Executive Summary is condensed from various sections of this report.

2.0 PRINCIPLES OF PAVEMENT MANAGEMENT

This section provides an overview of pavement management, including its objectives and the best practices for M&R planning throughout the lifecycle of a pavement. It also highlights the integration of these concepts in the ESA pavement management system, which was used in this report to develop recommendations and analyze the City's pavement network. This context is important for understanding the content and findings of the report.

2.1 Pavement Management Principles

Pavement management is the process of assessing, prioritizing, and preserving or rehabilitating pavements through a logical system that attempts to use available funds in the most cost-effective manner possible. The process is iterative, and as more data becomes available, prediction models are refined to improve accuracy. **Figure 4** illustrates that pavements typically start deteriorating rapidly once they hit a specific threshold. Therefore, it is more cost-effective to invest in cheaper surface treatments during the first 40% of a pavement's lifespan than to defer maintenance until heavier overlays or reconstruction is required just a few years later. Streets that are repaired while in good condition will have an extended lifespan and will cost less to maintain over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets will require more frequent reconstruction, thereby requiring significantly greater funding.

Figure 4 - Pavement Deterioration and Life Cycle Costs

The types of rehabilitation activities that the City chooses to deploy can have a significant effect on the longevity of a pavement. Depending on the PCI zone in which a pavement falls, a detailed rehabilitation strategy needs to be formed. Common rehabilitation types include localized preventive or stop gap activities (e.g. crack sealing, joint sealing, and patching), global preventive maintenance (e.g. fog seals, rejuvenators, slurry seals, microsurfacing, chip seals, cape seals, and thin overlays), major Rehabilitation (e.g. thin or thick mill and overlays), and major Reconstruction (e.g. surface reconstruction or full reconstruction). Popular examples of cost-effective preventative activities include:

- Crack and Joint Sealing
- Microsurfacing
- Fog Seal and Rejuvenators
- Patching
- Slurry and Chip Seals
- Thin Overlays

A proactive pavement management program focuses on the preventative maintenance category and advocates proper incorporation and application of cost-effective preventative activities. These activities help maintain and repair the surface integrity which can slow deterioration and, depending on the treatment, also extend the life of a pavement. The outcome of this exercise is to increase long-term cost savings and network-level pavement quality over time.

Crack sealing can be a cost-effective treatment when applied while the pavement is still in a state of good repair and also as preventative maintenance on a non-residential street to reduce the amount of asphalt patching at the time of street resurfacing. This treatment consists of applying a highly elastic material into pavement cracks to prevent or reduce the intrusion of water beneath the asphalt pavement. The benefits of crack sealing include decreasing further crack deterioration, protecting the pavement structure from moisture damage, and ultimately extending the pavement's life. In Santee, crack sealing is typically completed up to 1 year in advance of street resurfacing.

When completed within the target zone for preventative maintenance, a pavement's lifespan can be conveniently extended. The dashed curves in **Figure 5** show the typical lifespan of a pavement that does not undergo any preventive maintenance. Major reconstruction becomes necessary after approximately 20 years. The blue curves show the benefits of preventive maintenance during the first 40% of a pavement's lifespan. Eventually, all pavements will need to undergo reconstruction; however, proactive maintenance and rehabilitation can delay this process for up to an additional 40 years.

Figure 5 - Pavement Life Cycle Curve

The most effective approach to ensure optimal usage of available funds or to determine the necessary funding to achieve a predetermined level of service is by using a pavement management system. An effective pavement management system can assist agencies in developing an organized catalog of pavement assets, storing periodic condition assessments, and tracking spending and costs. This enables the City to compare trends in data to assess the effectiveness of maintenance activities and new technologies.

3.0 DATA COLLECTION AND ANALYSIS

3.1 Field Survey Methodology

IMS deployed one of its IrisPro Pave Integrated Road Information Systems for data collection. IrisPro Pave integrates industry-leading subsystems, including 3D pavement imaging systems, lasers, accelerometers, right-of-way cameras, GPS antenna, distance measurement instruments, computers and more (**Figure 6**). All collected data is captured with Drive™ data collection software, which is designed to simplify the collection of quality road data with built-in calibration schedules, real-time quality control, GIS maps, section tracking, audible alerts and voice memos, fly-by events, and exception reporting. The custom-designed hardware and software on IrisPro Pave provides sub-millisecond synchronization between all subsystems.

- ✓ **Teledyne FLIR Ladybug 5+**
Captures 360° Imagery at Defined Intervals
- ✓ **ASTM Class 1 IrisPRO Pavement Profiler**
Continuous Right and Left Wheel Path Roughness Measurements
- ✓ **Pavement Distress Imaging**
LCMS-2 Continuous 3D Imaging, 1mm Resolution
- ✓ **Drive™**
Automated Data Collection Paired with Field Observations
- ✓ **GPS Positioning**
GPS with Integrated IMU, Sub Meter Positional Accuracy
- ✓ **Samsara Monitoring**
Real-Time Tracking and Reporting
- ✓ **Texture**
Continuous Surface Texture Measurements
- ✓ **Linear Distance Positioning**
DMI for Precise Linear Distance Measurements
- ✓ **Safety Lighting**
Front and Back Facing Flashing Lights Ensure High Visibility

IrisPRO Pave

Figure 6 – LCMS-2 data collection vehicle

3D Pavement Imaging

The Laser Crack Measurement System (LCMS-2) captures continuous 2D and 3D images at 1 mm resolution in the lane of travel up to 4 m (13 ft) wide at highway speeds, allowing for the visualization and characterization of all features on the road surface. The system allows for collection rates up to 28,000 profiles per second, five times faster than the first edition of LCMS. This allows smaller

cracks, especially transverse cracks, to be detected more consistently than in the past. The vertical accuracy has also improved from 0.50 mm to 0.25 mm.

High-Definition Imaging

The Ladybug 5+ captures high quality 30MP spherical images using six cameras for a 360-degree view of the roadway and surroundings. The images can be viewed in panoramic mode, 360 mode, or individual directional images can be extracted at any desired camera angle. Both the Pavement imaging and right of way cameras are triggered on a fixed-distance basis, image capture is precisely synchronized to GPSTime and DMI, and cameras are calibrated for asset inventory and geo-referenced image measurements.

3.2 Data Collection Vehicle Validation Testing

To verify the reliability of the survey data, each IRISpro Pave platform is subjected to a series of rigorous tests on a bi-annual basis. The primary objective of these procedures is to ensure the accuracy, reliability and performance of the vehicles' equipment and systems. Certification and validation play a vital role in guaranteeing that vehicles meet stringent quality standards and comply with specific acceptance criteria for any pavement data collection job.

The validations testing procedures include a focus on GPS accuracy, profiler certification, rutting and faulting measurements, pavement surface texture and crack detection capabilities.

GPS Validation

The GPS validation test involves a procedure in which a vehicle must successfully present data with a sub-meter precision in order to pass. This is accomplished using a 180-degree test which is shown in **Figure 7** below.

Figure 7 – GPS Validation Test

With the vehicle parked on the marked location (indicated by the red +) a data collection event is started. The collection vehicle is then maneuvered 180 degrees so that the marked location is in the same relative position to the vehicle, with the vehicle now facing the opposite direction. Here another collection event is initiated. This process is repeated several times to ensure the accuracy of the test. The accuracy of the internal GPS is then measured against the reference point (the red +) and scored for sub-meter accuracy.

Profiler Certification

The profiler certification is conducted according to the AASHTO R56 standard and using a design analysis software called ProVAL to ensure accuracy and repeatability. Prior to collecting the 10 repeated precision runs needed to validate the profiler for International Roughness Index (IRI) measurements, a series of additional vehicle checks are performed including:

- Laser Calibration
- Block Check
- Bounce Test
- Tire Pressure Check
- DMI Calibration

Validation Loop

The validation loop includes four preapproved pavement locations with pavement conditions specifically chosen to measure IRI, rutting, faulting, texture, and crack detection. The specific locations are selected ahead of the test and then all collected in a single run. The validation loop includes multiple pavement types and surface conditions, as well as segments with previously identified rutting and surface distresses. The total length of the validation loop is approximately 3.5 miles but may vary slightly when additional testing sites are chosen.

To score the survey results of the validation loop the data is compared to a baseline, which is an average gathered by other validated survey vehicles, combined with readings from the SurPro5000 walking profiler. These results are compared for a minimum passing repeatability score of 92% which identifies how closely the tested vehicle's survey results compare to the baseline.

The testing survey results are then analyzed through the Connect platform and subjected to similar quality control measures detailed in the following section. Connect is used to confirm that the profiler data, the LCMS pavement imagery, the forward camera imagery, and the GPS data are all perfectly synchronized. As shown in **Figure 8**.

- The pavement window (top left) shows that the profiler and the LCMS are in sync, as the target position (the white stripe in the LCMS pavement image marked by the green square) matches the position (profiler), indicated by the red vertical line centered on the red square.
- The map (top right) shows that the GPS position is correct, as the event position (profiler), indicated by the red square box is where the tape is on the ground.
- The forward image (bottom) shows that the target tape is close to the bottom of the image.

Figure 8 – Lever Arms Final Validations Check

3.2 Data Quality Assurance

The collected data is processed in the office using the Connect™ software. Connect provides a perfectly synchronized multi window platform to view and alter all collected data including profile, distress, slope, International Roughness Index (IRI), events, images, and GPS map. **Figure 9** shows some examples of how data can be viewed in Connect. Using Connect, the LCMS-2 3D pavement images are analyzed to identify and classify distresses, and the longitudinal profile of the road is analyzed to determine the IRI and ride quality under the wheel paths according to industry standards. All processed data is matched to the segment ID of the roadway.

To ensure the accurate determination of PCI scores, the field data undergoes a rigorous series of processing phases and quality checks. These checks encompass synchronized assessment of both processed and raw data streams. The automatic distress identification and classification process involves various steps: First, different rules and processing parameters are applied on different pavement types; next, the auto detected lane markings are manually adjusted to exclude non-pavement areas and limit the assessment area for cracking and rutting to between the lane markings and invalidation rules are applied to exclude additional anomalies (e.g. near railroad crossing or bridge decks) from the assessment area. Finally, a team of pavement raters who are well-versed in both the distress standards and the data in its digital format review images and make the necessary corrections on areas with gross under/over detection.

Figure 9 - QC Image from Connect™ Software

To further confirm the accuracy of our condition data, spot checks are conducted on a network-wide basis by both the QC team and engineering staff. These spot checks are carried out on a random selection of road sections across the entire network to verify that the condition data is consistent and accurate. They also help to identify any potential issues that may have been missed during the initial data collection and review process.

Once the QC team and engineering staff have established the integrity of the data, an initial condition spreadsheet with detailed data and summary tables and charts is prepared and submitted for review by the Client. This review process involves a careful examination of the condition data and includes a comprehensive analysis of the data's completeness, accuracy, and consistency before preparing data for import to City's pavement management system.

3.3 Pavement Condition Survey

The goal of the pavement condition survey is to determine an accurate rating for each pavement section. The process of collecting and assessing data involves both automated and manual observations that originate from the data collected with the IrisPro Pave equipped with LCMS-2 downward imaging lasers, an array of 4k cameras, and trained rating personnel.

Within the "Network Analysis" tab in ESA, IMS has populated values for Surface Distresses, Roughness score, and Strength Rating. These three indices form the foundation on which ESA operates. They allow weighing factors to be uniquely specified for PCI calculation.

Surface Distress Index (SDI)

ASTM D6433 provides a method of categorizing surface distress observations for both asphalt and concrete pavements, based on the extent and severity of distresses along the roadway. The Surface Distress Index (SDI) is used to represent the observed pavement defects on a scale from 0 to 100. However, not all surface distresses are given equal weight. Load-associated distresses (LAD), such as rutting or alligator cracking on asphalt streets, and divided slabs on concrete streets, have a greater impact on the SDI than non-load associated distresses (NLAD), such as raveling or longitudinal and transverse cracking. Even when present in low extents and moderate severity, LAD can significantly decrease the SDI. The SDI inputs are shown in **Figure 10**.

Figure 10 - SDI Inputs and Detailed Scale

ASTM D6433 covers nearly forty unique distress types that may or may not be present in an agency's road network. For that reason, IMS uses a modified approach that collects the most common and relevant and repeatable distresses. The descriptions in **Table 1** outline some of the distresses collected for the City:

Table 1 - Distress Descriptions

Distress Type	Pavement Type	Description	Example
Alligator Cracking	Asphalt	• Quantified by severity and square footage • Caused by the repeated bending from vehicle loads • Propagate from the bottom, meaning that structural failure has occurred • An LAD with significant impact on the condition score, even at low extents	
Rutting	Asphalt	• Caused by the permanent deformation of the pavement and/or subgrade layers • Low densities can have a large impact on the final condition score due to their implication of possible structural failure	
Longitudinal & Transverse Cracking	Asphalt	• Quantified by their length and width • Results from pavement shrinkage due to natural daily and seasonal temperature cycles, construction issues, or other factors	

Patching	Asphalt	• Quantified by the square footage and severity • Always considered a surface defect • Affects ride quality and condition of a pavement	
Distortion	Asphalt	• Bumps and sags, depressions, swell, corrugation, and shoving • Caused by several factors, such as construction issues, subgrade mixture failure, environmental influence, etc.	

Structural Index (SI)

Structural adequacy testing was not requested by the City. Instead, IMS investigated the relationship between the PCI and the number of LAD observed in each pavement section to generate structural indices. Based on this analysis, each section was assigned a rating of Weak, Moderate, or Strong in terms of its strength. These ratings were represented by an SI of 30, 60, or 80, respectively. The established SI was not used in calculating the overall pavement condition score but rather to help determine appropriate rehabilitation strategies based on the pavement strength rating.

Roughness Index (RI)

The Roughness Index (RI) provides a quantifiable measure of ride quality, which is determined using the industry-standard ASTM E1926 for calculating the IRI. This value is derived from the longitudinal profile captured by the LCMS as it records the change in elevation over a distance. Once calculated, it is expressed as a slope and reported in millimeters per meter (mm/m). Typical IRI levels for new, older, and damaged pavements are displayed in **Figure 11**. The IRI is lower on average for roads or pavements that are normally used for higher speed travel.

Figure 11 - IRI Scale Definitions

To enable the use of a blended condition score that incorporates both PCI and IRI scores, the IRI value is converted to an equivalent scale for analysis purposes. This is achieved by converting the IRI value into a score on a scale from 0 to 100 and reporting it as the RI using the following formula:

$$RI = (11 - 3.5 \times \ln(IRI)) \times 10$$

$\ln(IRI)$ is the natural logarithm of IRI.

To provide some context, a newly constructed street would typically have an RI value of above 85, whereas a street that requires an overlay would fall within the range of 40 to 70. Roadways in poor condition generally have RI values below 40, although they may achieve higher blended scores if the distresses responsible for the low RI score are not due to structural failure or other severe causes. For instance, rapid construction can lead to a pavement surface with less-than-optimal smoothness, resulting in a low RI value. However, since the distress or imperfection is not caused by severe failures within the pavement structure, the blended PCI value may not be significantly affected.

Pavement condition index (PCI) – Following the field surveys, the condition data was imported to ESA for calculating the overall PCI. The PCI for each segment was calculated using the following percentages of weighing factors:

$$PCI = 67\% SDI + 33\% RI$$

Table 2 presents each PCI category along with a brief description of the typical distresses and recommended treatments for each.

Table 2 – Pavement Condition Categories

Category	Typical Distresses and M&R Recommendations	PCI Range
Excellent	Like new condition – little to no maintenance required. Monitor condition, crack seal, slurry seal	85<PCI≤100
Very Good	Minor cracking, raveling, and other NLAD Routine or preventive maintenance. <i>E.g., Crack sealing, slurry seal</i>	70<PCI≤85
Good	Minor to moderate cracking and low severity LAD such as alligator cracking and rutting. Surface treatments with localized repairs and overlays <i>E.g., Cape Seal</i>	60<PCI≤70
Fair	More extensive and severe longitudinal and transverse cracking, as well as moderate severity LAD Localized repairs or major rehabilitation. <i>E.g., Cape Seal or Overlay</i>	50<PCI≤60
Marginal	Localized high-severity alligator cracking, and rutting Major rehabilitation. <i>E.g., traditional overlay</i>	40<PCI≤50
Poor	A greater extent of severe alligator cracking, rutting Major rehabilitation. <i>E.g., traditional overlay or full depth reconstruction</i>	25<PCI≤40
Very Poor	Extensive and severe alligator cracking, more extensive and deeper rutting, and potholes. Major rehabilitation. <i>E.g., Full-depth reconstruction</i>	0<PCI≤25

3.4 ESA Pavement Management System

The ESA software provides all the functionalities of a standalone software package while being user-friendly. It provides the City with a tool that can effectively catalog, classify, assess, track, and analyze condition data to aid in the processes of budget planning and pavement rehabilitation.

More specifically the program helps the City streamline its pavement management by giving structure to the basic information required for a management system:

- Pavement Section Inventory
- Pavement Deterioration Modeling
- Funding Analysis
- Prioritization
- Rehabilitation Selections

Pavement Section Inventory

An accurate inventory of all City-owned streets is necessary to make any determinations, assumptions, or projections within a management system. Individual attributes such as length, width, location, traffic use, surface type, condition, and other factors may be tracked and tied back to a single management segment within ESA. Thereafter, they are given a unique ID within the program. These attributes are critical in determining appropriate rehabilitation activities, prioritizing the management segments within the system, and facilitating placement and sorting during reporting.

Pavement Deterioration Modeling

Inspection data by itself is only capable of representing conditions at the time of collection. Nevertheless, within ESA there are customizable curves that can predict the rate of pavement deterioration based on a streets functional class, pavement type, and strength rating. These deterioration curves are critical in predicting future pavement conditions and determining appropriate rehabilitation strategies. The model assumes that pavements with similar attributes and usage will deteriorate at similar rates. For instance, high volume asphalt arterials that are already in poor condition are expected to deteriorate faster and are represented in **Figure 12** by a purple line. In contrast, low volume concrete local streets are expected to deteriorate slowly and are represented by a blue dashed line.

Figure 12 - Asphalt Concrete Pavement (ACP) and Portland Cement Concrete (PCC) Deterioration Curves

Rehabilitation Work Selections & History

ESA uses a set of protocols that allow for activities to be assigned to PCI ranges based on filter criteria that give the City the ability to create detailed rehabilitation strategy sets for each functional class and pavement type according to the best practices determined for that pavement.

As planned rehabilitation work is completed, a record of the work should be added to the pavement management system. This ensures that conditions are up to date for future selections and creates a repository of information to aid in planning.

Prioritization

Within ESA, the option is available to prioritize pavement projects for rehabilitation based on six main criteria: PCI, Cost of Deferral, Pavement Strength, Pavement Type, Functional Class, and the Area of a segment. Depending on the goals set forth at the beginning of the project, these criteria can be weighted differently based on their definition to create an overall priority factor for a project. Additional details on these factors are available in Section 5.

Project planning

The ability to plan work as needed allows the management program to better reflect the realities of a paving program. Certain constraints may be applied to funds that require their use within a certain year and activities relating to other assets may dictate the time and type of work to be performed. ESA allows for predefined projects to be entered into the management plan to account for work that is known. This ensures that the outcome is consistent with overall City planning and accurately reflects current funding allocations.

In terms of pavement management efficiency, a program based on worst-first, that is starting at the lowest-rated street and working up towards the highest, does not achieve an optimal expenditure of funds. Generally, under this scenario, agencies cannot sufficiently fund pavement rehabilitation and lose ground despite injecting large amounts of capital into the network.

The preferred basis of rehabilitation candidate selection is to examine the cost of deferral of a street against increased life expectancy.

Funding analysis

The actual process of determining where and when to spend funds is a function of the inputs mentioned in this section. Information from the street section inventory, condition survey, deterioration modeling, rehabilitation activity protocols, prioritization, and project planner are all assessed to predict the potential outcomes of funding scenarios. These can either be goal-based or budget-based. A more detailed description is available in Section 5.0.

3.5 Summary

This section outlined the fundamental concepts of pavement management and described the implementation process for the City's pavement management system. The operating parameters of ESA were reviewed, and the inputs provided by the LCMS-2 technology were explained to provide context for calculating PCI, Roughness Index, and Pavement Strength.

4.0 PAVEMENT CONDITION SURVEY RESULTS

This section will review the results of the pavement condition survey performed in July of 2025. The segments were deteriorated using the defined pavement deterioration models to reflect the conditions of the roadways at the time of analysis (July of 2026). This section includes a summary of conditions in the functional classes used in the City's analysis, followed by a review of network photos taken from the survey vehicle. A series of charts will then summarize the findings of the condition survey and provide an overview of the PCI distribution across the City's pavement network.

4.1 City Street Inventory and Condition Summary

The City of Santee is currently responsible for approximately 126 centerline miles (29,192,577 SF, 1528 streets or approximately 159 survey miles) of pavement with an **overall PCI of 69** and a **backlog of 11%**. The following **Table 3** presents the City's inventory and pavement condition breakdown across different functional classes. Detailed information for each management section is available in **Appendix A**.

Table 3 – Network Inventory Summary by Functional Class and Pavement Type

TYPE OF STREET	NUMBER OF STREETS	SQUARE FOOTAGE	% OF TOTAL SF
RESIDENTIAL	1134	17,442,281	59.7%
COLLECTOR	164	3,678,058	12.6%
INDUSTRIAL	30	758,188	2.6%
MAJOR	151	5,197,305	17.8%
PRIME	37	1,328,131	4.5%
PARKWAY	12	821,122	2.8%
TOTAL	1528	29,225,085	100%
SUMMARY	NUMBER OF STREETS	SQUARE FOOTAGE	% OF TOTAL SF
RESIDENTIAL	1134	17,442,281	59.7%
NON-RESIDENTIAL	394	11,782,804	40.3%
TOTAL	1528	29,225,085	100%

The City of Santee consists of 6 functional classes. The Residential network makes up the majority of the pavements in the City and has a PCI average of 71. This is an improvement over the previous survey in 2022, which recorded the residential network average PCI at a 66. **Table 4** shows all Functional classes weighted average PCI comparing 2025 to the survey in 2022.

Table 4 – Year to Year Functional Class Comparison

Functional Class	Average Weighted PCI (2022)	Average Weighted PCI (2025)
Prime Arterial	54	69
Major Arterial	64	66
Major Collector	55	66
Industrial Collector	49	42
Residential	67	71
Parkway	73	75

4.2 City Network Condition Imagery

The images presented in this section provide a sampling of the City's streets that fall into various condition categories. A discussion of potential rehabilitation strategies is included for each category.

Very Poor (PCI = 0 to 25) – Complete Reconstruction (Approx. 1% of City Streets)

River Valley Court from Pebble Beach Drive to East End (GISID 1244, PCI = 23) – Rated as Very Poor, this street displays a large quantity of alligator cracking and potholes severe enough to suggest that the pavement structure is inadequate for current traffic loads. The rehabilitation of roads in this condition through a mill and overlay is generally ineffective, as the failures usually extend to the bottom of the pavement layer. Streets in this condition require rehabilitation that involves removal and replacement of the asphalt layer, base stabilization, or complete reconstruction based on design requirements.

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in overall pavement quality. The streets have passed the opportunity for overlay-based strategies, meaning that reconstruction, which can be expensive, is the most suitable solution. Thus, Very Poor streets are often deferred in favor of rehabilitating more streets at lower costs, resulting in a greater net benefit to the City. This strategy, however, must be sensitive to citizen complaints that may demand the prioritization of these street repairs. In addition, this type of street can pose a safety hazard for motorists since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

Recommended Treatment: Reconstruction

Estimated Cost per Square Foot (\$/SF): \$11.30

**Poor (PCI = 25 to 40) – Last Opportunity for Surface and Base Rehabilitation
(Approx. 10% of City Streets)**

Cuyamaca Street from Riverwalk Drive to Bingham Road (GISID 2306, PCI = 36) – Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, a fair amount of the segment contains alligator cracking. If left untreated, a partial to full reconstruction would be required within a short period of time.

On heavily trafficked roadways, Poor streets often require partial to full reconstruction. On local roadways, they generally require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

Recommended Treatment: Thick 3" Overlay

Estimated Cost per Square Foot (\$/SF): \$4.70

Marginal (PCI = 40 to 50) – Thick Overlay
(Approx. 9% of City Streets)

Olive Lane from Mac Cool Lane to Mission Gorge Road (GISID 2101, PCI = 48) – This street displays transverse and longitudinal cracking across the middle and edges of the pavement. There are sections of alligator cracking dispersed along the segment as well as a few isolated sections that may require structural patching.

Marginal streets that display high amounts of load associated distresses (LAD) are selected as a high priority for rehabilitation as they generally provide the best cost/benefit ratio to the City. If left untreated, Marginal streets with high amounts of LAD will deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

Recommended Treatment: Moderate 2" Overlay
Estimated Cost per Square Foot (\$/SF): \$3.70

Fair (PCI = 50 to 60) – Moderate Overlay
(Approx. 9% of City Streets)

Woodside Avenue from Private Road to SR-67 RA (GISID 1764, PCI = 57) – Fair streets have similar characteristics to Marginal streets in that the distresses present tend to be localized and moderate in severity; however, the distresses will predominately be non-load related (i.e., caused by environmental or other factors). This street displays longitudinal and transverse cracking towards the middle of the pavement.

Like Marginal streets, Fair streets can provide a good cost/benefit ratio to an agency if addressed with an adequate maintenance / rehabilitation technique. Stretching the application for surface treatments into this range can pose a cheap alternative to overlays but does not provide the appropriate renewal to the structural capacity of the pavement and may allow load related deterioration to continue unabated.

Recommended Treatment: Cape Seal
Estimated Cost per Square Foot (\$/SF): \$2.75

Good (PCI = 60 to 70) – Surface Treatments
(Approx. 16% of City Streets)

Bingham Road from Cambury Drive to Cuyamaca Street (GISID 2073, PCI = 67) – Rated as Good, the primary cause of deterioration for this street is the low severity longitudinal and transverse cracking. The pavement surface could be restored with spot patching to remedy the more heavily distressed areas.

Preventive measures on streets considered Good can have a positive impact on the City's funding needs. While the expected life of a slurry seal is not as long as that of an overlay, its ability to slow deterioration and relatively low cost can free up funding for streets in worse condition.

Recommended Treatment: Cape Seal
Estimated Cost per Square Foot (\$/SF): \$1.95

Very Good (PCI = 70 to 85) – Surface Treatments and Localized Rehabilitation
(Approx. 36% of City Streets)

Carlton Hills Boulevard from Stoyer Drive to Carlton Oaks Drive (GISID 2253, PCI = 76) – Rated as Very Good, this street displays minor amounts of transverse cracking. It is an example of a candidate for preventive maintenance to extend the life of the roadway.

Also, routine maintenance prevents water intrusion by crack sealing and slowing crack growth. By keeping water out of the base layers, the pavement life is extended without the need for costlier rehabilitations.

Recommended Treatment: Slurry Seal
Estimated Cost per Square Foot (\$/SF): \$0.85

Excellent (PCI = 85 to 100)
(Approx. 19% of City Streets)

El Nopal from Holborn Street to Julio Place (GISID 1747, PCI = 95) – Rated as Excellent, this pavement displays little to no surface distresses. The ride is smooth, and the surface and the base are intact. Excellent roads should be periodically assessed for crack development that would trigger routine maintenance activities.

Recommended Treatment: Slurry Seal
Estimated Cost per Square Foot (\$/SF): \$0.60

4.3 City Network Condition Distribution

Figure 13 shows the distribution of pavement condition for the roadway network in Santee.

- **21% (up from 8% in 2022)** of the network can be considered in Excellent condition and should be closely monitored to ensure timely application of early localized preventive measures, such as crack sealing.
- **36% (up from 33% in 2022)** of the network falls into the PCI range considered Very Good. These are roads that benefit most from preventive maintenance techniques, such as patching and slurry seals.
- **15% (down from 22% in 2022)** of the streets are rated as Good and may still be candidates for slurry seals or cape seals.
- **18% (down from 26% in 2022)** of the network can be considered in Fair to Marginal condition and represents candidates for overlay-based rehabilitation. If left untreated, they will decline rapidly into reconstruction candidates.
- **11% (consistent with 11% in 2022)** of the network is rated as Poor or Very Poor, meaning these roadways have deteriorated to the point where surface rehabilitation can no longer restore the pavement to a point of structural adequacy. Rehabilitation of the entire pavement structure is required for these segments.

Figure 13 - Roadway Network Present Status Using Descriptive Terms

4.4 Condition By Functional Classification

Analyzing subsets of data in addition to the overall pavement condition can provide a better understanding of where an agency should focus its resources. **Figure 14** displays the distribution of pavement conditions for each functional class.

Figure 14 - Condition Rating by Functional Classification

When evaluating the condition of pavement based on the percentage of network it covers, the proportion of each class in the overall network must also be considered. This distribution is illustrated in **Figure 15**. Therefore, the City should focus its preventive maintenance efforts on the class types that contribute to a greater degree to the overall network.

Figure 15 - Functional Classification Distribution By Area

It is important to note that the Industrial network, while only representing 2% of the overall paved network, has a very high percentage of segments in the poor and very poor categories. While most functional classes in the City network have shown improvement since the 2022 survey, the Industrial class has seen a drop in average PCI from 48 to 43. Residential and Prime Arterials, have both seen PCI improvements since the last survey.

4.7 Summary

Section 4.0 of the report provided a detailed analysis of the results obtained from the pavement condition survey conducted in the City of Santee. The section covered the functional classifications in the City and their respective PCI values, which were further illustrated with pavement photographs taken during the survey. Additionally, the section provided a breakdown of the pavement condition distribution for each functional class and pavement type. Overall, the network average **PCI for Santee, CA was found to have a PCI of 69 with a backlog of 11%. This shows an improvement over the PCI of 65 that was reported in 2022.**

5.0 REHABILITATION PLAN & BUDGET DEVELOPMENT

This section discusses the results of the pavement management analysis that was performed using the ESA pavement management system, starting with an overview of the assumptions that were used when implementing the system, such as the unit rates and the selection methodology for rehabilitation candidates. The subsequent section, **5.2**, details the results of each of the various budget runs, along with their predicted conditions. This is highlighted further through a series of charts that are used to demonstrate the advantages and disadvantages of various funding models.

5.1 Key Analysis Set Points and Assumptions

Pavement management analysis requires user input to complete its condition forecasting and prioritization. A series of operating parameters were developed to create an efficient program that is tailored to the City's needs.

Selecting Segments for Rehabilitation

The selection of rehabilitation candidates through a worst-first approach or subjective committee input is neither efficient nor cost effective. It is important to establish a set of criteria and determine their importance in the selection process. ESA has defined commonly used criteria within the program that allows different weighting factors to be applied depending on the City's goals. This approach can lead to more objective and effective selection of rehabilitation candidates.

- **PCI** – As mentioned earlier in this section, the results of the pavement condition survey are used to generate a PCI that ranges from 0-100 where 0 is considered the worst and 100 the best. This factor can be given a higher weight to give greater priority to poor condition streets.
- **Cost of Deferral** – As time passes a pavement will deteriorate and require more costly repairs as it ages. ESA can be configured to prioritize streets nearing the point where this cost increase occurs.
- **Planned or Committed Projects** – When developing the rehabilitation plan, projects that are already scheduled to be completed are taken into consideration. This is done by adjusting the PCI scores to reflect the expected improvement resulting from these projects.

For the City, the weighting factors for these categories were established with the aim of maximizing the cost savings associated with the concept of deferred maintenance and addressing Weak pavements with lower PCI scores. The goal is to minimize the growth of the backlog.

Rehabilitation Strategies and Unit Rates

The funding requirements for the City are mainly determined by the rehabilitation strategies and unit rates used in the budget analysis. **Table 4** presents a breakdown of the estimated costs associated with different pavement rehabilitation activities and their application. Prices will vary based on several factors including street type, project size, budget, etc... Concrete pavement types are excluded from the table as they account for less than 1% of the surveyed network's total distribution, but their information can be found in the accompanying data file. The table also suggests a recommended rehabilitation funding sequence based on the cost of deferral. A lower number in this column indicates a higher priority for rehabilitation based on the cost of deferral.

The parameters to consider when forming rehabilitation strategies include:

- **Rehab Activity** – This includes the assigned identifier and name of each rehabilitation strategy. Various degrees of slurry sealing are outlined to highlight the increasing cost associated with additional patching requirements for lower PCI streets.
- **Min, Max, and Critical PCI** – The PCI range for the application of a specific rehabilitation activity is determined by the Min and Max values that set the upper and lower limits, while the Critical PCI indicates the threshold at which rehabilitation becomes a higher priority to leverage the cost of deferral factor. There can be overlap in the PCI range to allow for further differentiation based on pavement strength.
- **Unit Rates** – The cost of rehabilitation is presented per square foot for each combination of pavement type, functional class, and rehabilitation activity. A base unit rate is set for the lowest assumed cost of a work type, and it is adjusted for each functional class to account for additional work such as traffic control, intersection improvements, landscaping, utility adjustments, and right-of-way (ROW) infrastructure. IMS worked closely with the City to determine rates that accurately represent the cost of work.
- **Selection and Prioritization of Rehab Candidates** - The City's pavement management program incorporates a series of user defined values to prioritize and select the street segments for rehabilitation. The rehab selection order is not worst first, but rather designed to capture as many segments in their need year based on the incremental cost of rehab deferral. A street is considered to be in its need year when it has reached its maximum service life and any further deferral would require a heavier and more costly rehabilitation. The rehab program has been designed to maximize the increased service life for each rehabilitation dollar spent on a segment for non-residentials and at the zone level for residentials.

Table 5 – Rehabilitation Rates

Rehab Activity	Min PCI	Max PCI	Base Unit Rate (\$/ft2)
FunCL Rate Premium			
Slurry Seal	85	100	0.60
Slurry Seal	70	80	0.85
Cape Seal	60	70	1.95
Cape Seal	50	60	2.75
Moderate Overlay (2")	40	50	3.70
Thick Overlay (>3")	25	40	4.70
ACP Remove and Replace	0	25	11.30

In Santee, the M&R strategy revolves around strategic use of four primary pavement treatments.

Slurry seal is a maintenance strategy applied to help preserve and protect the underlying pavement structure and provide a new driving surface. Roads chosen for slurry seal applications generally have low to moderate distress and narrow crack width.

Cape Seal is a maintenance strategy an application of chip seal followed with a slurry seal. The benefits from using a cape seal include a smooth surface with an increased durability by sealing and bonding cracks.

Overlay is a maintenance strategy that is the most cost effective of the rehabilitation techniques. To be a candidate for an overlay, pavement should be relatively sound without large areas of base failure. Overlays range from 1 ½" to 2" thickness.

Full Depth Remove and Replace (R&R) is a rehabilitation strategy that should be the last resort for pavements that are past the point where overlays and base patching are effective. These streets generally show signs of full-depth pavement failure and may include areas of missing pavement.

Table 6 shows the overlay vs surface treatment cost breakdown between Non-residential and residential streets. The table presents all 5-years of the analysis based on the City's current approved budget. Additional details are provided in the following section.

Table 6 - 5-year Overlay and Surface Treatment Cost Summary

Year	Residential			Non-Residential			Santee Network	
	Surf Trtmnt	Overlays	Total	Surf Trtmnt	Overlays	Total	Program Total	Santee Budget
2026	\$157,636	\$1,258,726	\$1,416,362	\$275,120	\$703,256	\$978,376	\$2,394,738	\$2,395,000
2027	\$444,039	\$343,376	\$787,415	\$1,186,741	\$491,776	\$1,678,517	\$2,465,932	\$2,466,850
2028	\$366,661	\$1,450,928	\$1,817,589	\$94,820	\$626,160	\$720,980	\$2,538,569	\$2,540,856
2029	\$157,664	\$2,067,690	\$2,225,354	\$133,738	\$254,466	\$388,204	\$2,613,558	\$2,617,082
2030	\$59,697	\$619,818	\$679,515	\$13,194	\$1,972,833	\$1,986,027	\$2,665,542	\$2,695,594
	\$1,185,697	\$5,740,538	\$6,926,235	\$1,703,613	\$4,048,491	\$5,752,104	\$12,678,339	\$12,715,382

5.2 Network Budget Analysis Models

The pavement management analysis using the ESA system involved combining the condition assessment, deterioration model, prioritization factors, and rehabilitation assignments to conduct a budget analysis. With this information, the program can predict the outcomes of different funding levels or suggest the funds necessary to achieve specific goals. To model network trends and estimate the funding levels needed to reach certain condition and distribution targets, IMS conducted an analysis using a series of budgets. The results of this analysis are detailed in this section.

Budget Targets

The following scenarios were generated to forecast the outcomes of the current estimated City budget compared to City's target PCI goals over the next five years. The models determine what level of funding may be appropriate going forward. The values for backlog and PCI have been rounded to the nearest whole number to improve legibility. Varying budget figures will have slightly different outcomes that are visible in the charts but may not be completely represented in the legend text.

Five-year Models:

- **Santee Budget** (Green Line) – This represents the City's current average annual budget of \$2.5M/Yr. dedicated to pavement preservation and rehabilitation. (This represents the average funding over 5-years) This level of funding will result in a network average PCI score of 66 and a backlog of around 14% after five years.
- **Scenario 1** (Red Line) – This level of funding of \$3.95M/Yr will result in a 5-year projected PCI of 69 with a backlog of 11%.
- **Scenario 2 Current funding + \$1M/Yr.** (Blue Line) – This level of funding of \$3.61M/Yr will result in a 5-year projected PCI of 69 with a backlog of 13%.
- **Scenario 3** (Orange Line) – This level of funding of \$4.55M/Yr will result in a 5-year projected PCI of 70 with a backlog of 10%.
- **Scenario 4** (Tan Line) – This level of funding of \$7.33M/Yr will result in a 5-year projected PCI of 75 with a backlog of 4%.

The results of the analysis are summarized in **Figure 16**. The x-axis highlights the annual budget, while the y-axis plots the five-year Post Rehab Network Average PCI values. The diagonal blue line is the network trend model developed to show estimated PCI along with a funding range up to \$7.5M/Yr.

Figure 16 – Five-year Post Rehab Network PCI Analysis Results

Figure 16 presents the resultant network backlog against the annual budget. It is similar to **Figure 17**, but instead of plotting the average PCI score, it displays the total backlog after five years with a blue diagonal line. The City currently maintains a backlog of 11%. As the backlog grows, the funding required to return to the current level will increase.

Figure 17 - Five-year Post Rehab Network Backlog Results

Figure 18 presents the analysis results on an annual basis.

Figure 18 - Five-year Annual PCI

5.3 Post Rehabilitation Condition

Figure 19 compares the percentage of the City's network area separated into each pavement condition category for two scenarios: the current network average condition (shown in red) and the projected condition in five years with the City's budget (shown in blue). The analysis shows that if the City's current budget is maintained, the average PCI is expected to decrease to 66 by the end of the five-year analysis period, and the backlog is projected to increase from 11% to approximately 16%.

Figure 19 – Comparison of Pavement Condition (Current to 5-year Projection)

5.4 Summary

The pavement analysis models conducted using the ESA program showed that the current annual budget of \$2.5M for pavement management would result in a decrease in pavement condition over a period of five years, resulting in a five-year post rehab PCI of 66 and a backlog of 16%. Maintaining the current backlog level at 10% would require an annual budget of approximately \$4.55M and increase the PCI to 70. These findings highlight the importance of adequate funding for pavement management to maintain the quality and safety of the City's roads.

6.0 PAVEMENT MANAGEMENT HISTORICAL DATA

Since the last report prepared in 2022 the City has resurfaced approximately 6,450,000/SF of streets at a total cost of nearly \$18.3M. These costs are the annual CIP resurfacing projects and to not include major street widening projects.

6.1 Zone Resurfacing

Below in **Table 7** is a summary of the zone resurfacing in Santee. This data was incorporated into the 2026 analysis.

In addition to annual funding for street resurfacing, the City Council has allocated an additional \$7,035,000 of General Funds since 2022 to be used for street resurfacing from 2022-2025. With the additional funding provided by City Council, 1,740,000 Ft² of streets and 17 streets were able to be resurfaced. **A total of 143 streets were resurfaced from 2022-2025.**

Table 7 - Historical Resurfacing Data

** = Zone created or subdivided in 2026

6.2 Past Report Summary

Table 8 presents a summary of previous pavement management reports in Santee, identifying prior recommended budgets and actual spending on pavement resurfacing.

Table 8 – Past Report Summary Table

Period	Areas Resurfaced by CIP Paving Projects		Budget Required to Maintain PCI	Total Spend on CIP Paving Projects	Average Spent Per Year
	Overlay	Slurry/Cape Seal			
2002 - 2007	1,719,394	2,676,448	Not Identified	\$5,779,102	\$963,183.67
2008-2012	2,071,656	2,129,454	\$3,200,000	\$5,304,206	\$1,060,841.20
2013-2016	977,398	1,353,085	\$1,970,000	\$13,282,257	\$3,320,564.25
2017-2021	1,280,999	3,638,387	\$3,280,000	\$6,238,207	\$1,247,641.40
2022-2025	1,590,350	4,842,254	\$2,870,000	\$17,069,433	\$4,267,358.43
Total	7,639,797	14,258,628		\$47,673,205	\$2,171,917.79

The following data summarizes the recorded PCI values and details about network conditions at the time of the report noted. Variations between conditions can be caused by multiple factors including, but not limited to: survey methodology, size and growth of the network, how and where rehabilitation funds were spent, longevity of rehabilitation techniques, and changes in traffic patterns.

Table 9 – Pavement Management Report History

Report Year	Non-Residential	Residential	Weighted Average

2026	62.4	71	69

7.0 PROJECT RECOMMENDATIONS & COMMENTS

7.1 Project Summary and Recommendations

A pavement condition survey was performed in July of 2025 on the full City pavement network. The results of the condition survey were aggregated into the ESA pavement management system. This system facilitated the creation of a georeferenced pavement inventory, enabled the development of a precise model of the network's current condition and anticipated future deterioration, and provided recommendations for street resurfacing.

The following broad recommendations are presented to the City as an output from the pavement analysis and must be read in conjunction with the previous sections.

- The City should make efforts to keep the ESA spreadsheet up to date.

By maintaining and updating the rehabilitation unit rates, work history of the segments, and accuracy of the inventory, the City will be able to reliably forecast funding needs for future years. This allows the City to be proactive in maintaining the condition of the pavement network at an acceptable level.

- The City should periodically resurvey the pavement network.

Pavement performance over time involves many variables, such as traffic volumes, environmental factors, maintenance timing, and design standards. As these variables change, the rate at which a pavement deteriorates will change with them. The periodic resurvey of pavement conditions allows the City to track these changes and update models accordingly, ensuring that appropriate rehabilitation measures are being planned.

- The City should investigate new and additional rehabilitation activities.

Advancements in pavement rehabilitation technology are constantly being made, and it is recommended that the City periodically update its planned rehabilitation activities in the ESA program to take advantage of these advances.

- The City should strive to maintain or better its current condition if possible.

Maintaining a pavement network in good condition is more cost-effective than restoring conditions after deterioration. The City's current pavement network has an overall PCI of 69 with a backlog value of 11%. If the current annual budget of \$2.5M is maintained, the models show the PCI will decrease to 66 and the backlog will hover around 14% after five years.

7.2 Closing

The IMS Team greatly appreciates the opportunity to work with the City on this pavement management update. Over the course of this project, the team has observed the City staff's dedication to offering the best possible service to their community. IMS stands ready to assist the City with training and technical support as necessary and welcomes the opportunity to work with the City on future pavement management projects.
