1.0 EXECUTIVE SUMMARY

1.1 Project summary

IMS Infrastructure Management Services, LLC (IMS) was contracted by The City of Santee, CA (City) to conduct a comprehensive pavement condition assessment and pavement management analysis on the City's roadway network. The objectives of this project were to: (1) perform a network-level condition survey of the City's roadways, (2) provide City staff with an updated pavement management system, (3) estimate the rate of deterioration of the City's pavements, and (4) estimate the future Maintenance and Rehabilitation (M&R) requirements for the City's pavement infrastructure.

IMS mobilized their Laser Road Surface Tester (RST) in September 2021 to conduct an objective pavement condition survey on approximately 126 centerline miles of City-maintained roads. The collected pavement imagery, surface distress data and roughness were analyzed following industry standards outlined in ASTM D6433 to determine the Pavement Condition Index (PCI) score for each segment of the road.

Next, the latest inventory and condition data captured during the survey was loaded into the Easy Street Analysis (ESA) software and combined with previous inspection data for analysis and M&R work planning. Additional training will be provided to City staff for customization and prioritization of cost-benefit analysis using ESA.

For more information on ESA see Section 3.3.

1.2 Metrics of Health

The following three network level metrics described below were calculated and monitored to understand Santee's network conditions and develop an effective pavement management program.

Network Average PCI –The network area weighted average PCI is a global indicator of a network's overall health. This is the most highly considered value when gauging overall pavement quality.

Percent of Excellent Roads – Roads with a condition category of Excellent are those that score between a PCI of 85 to 100 and include pavements recently constructed or repaved with minimal distresses.

Backlog – Backlog is the Very Poor and Poor roads (between a PCI of 0 and 40) that represent a portion of the network in need of extensive rehabilitation such as full or partial reconstruction.

Figure 1 presents an overview of Santee's pavement condition at the start of the analysis period. Roadways that were completed or planned for resurfacing or reconstruction after the field inspection was performed were assigned a reset PCI value and assumed to have been completed for the following chart.

Santee meets two of three metrics for evaluating the quality of its roadway network.

- ✓ Santee's network average pavement condition score meets the IMS recommended PCI of 60 to 65, with the City's weighted average scoring a **65**. In 2017, the City weighted average PCI was 62.
- The number of streets rated Excellent is below the minimum recommended target of 15% at **10%**
- ✓ The backlog amount is below the recommended value of 15% at **11%**

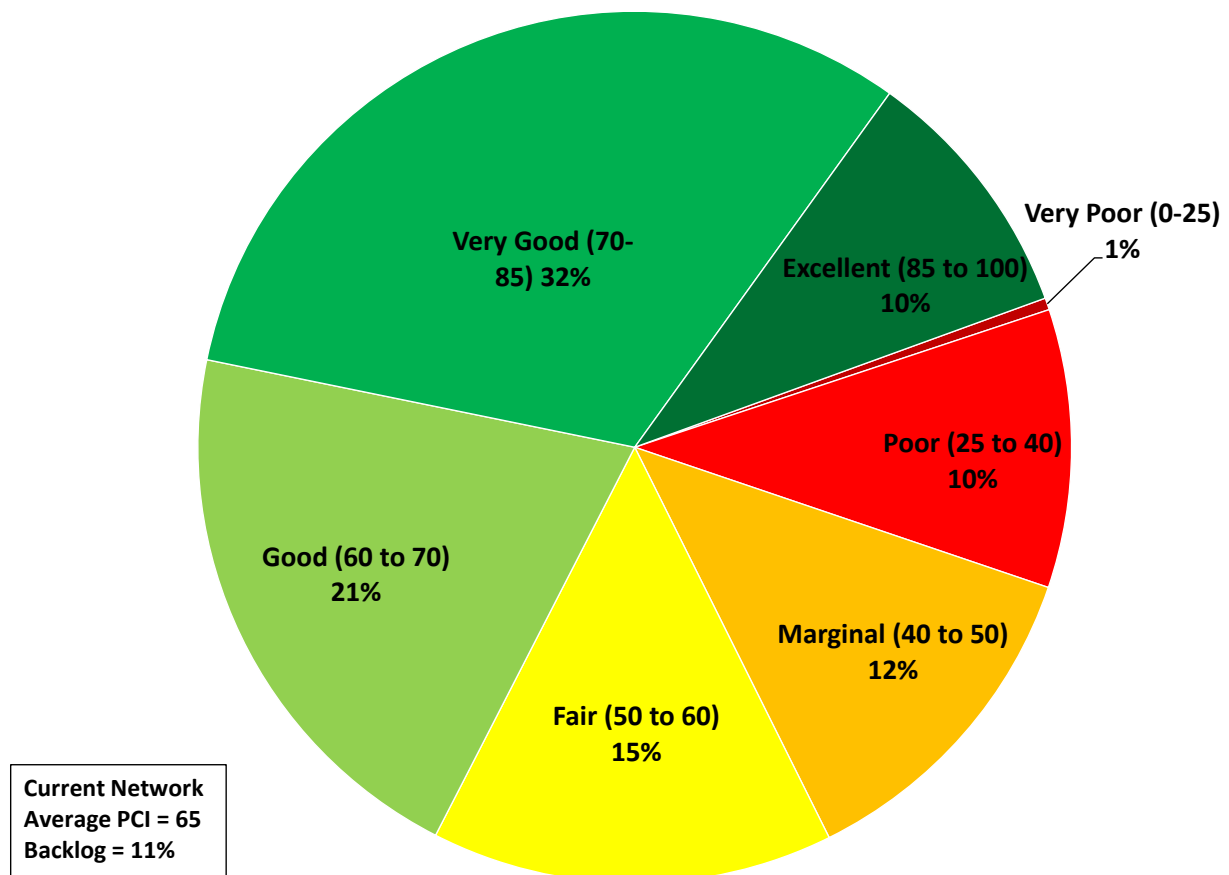

Figure 1 – Santee Street Condition Distribution

For more information on GFP categories see [Section 4.3](#).

1.3 Budget Scenarios and M&R Work Planning

The pavement management system was customized with City's rehabilitation strategies, unit rates, and deterioration models and was used to run several "What-If" scenarios to depict the consequence of different funding levels as well as the outcome of the City's current funding on street network conditions.

Figure 2 depicts the network average PCI for the City resulting from these different scenarios. The analysis shows that if the budget falls below \$2.87M/yr (Maintain PCI), over time the overall condition of the roads will deteriorate as backlog continues to grow. With the City's current average annual budget of \$1.74M dedicated to pavement M&R and previously planned

projects, the average PCI is expected to drop to a 59 by the end of the five-year plan and the backlog to increase to 24%.

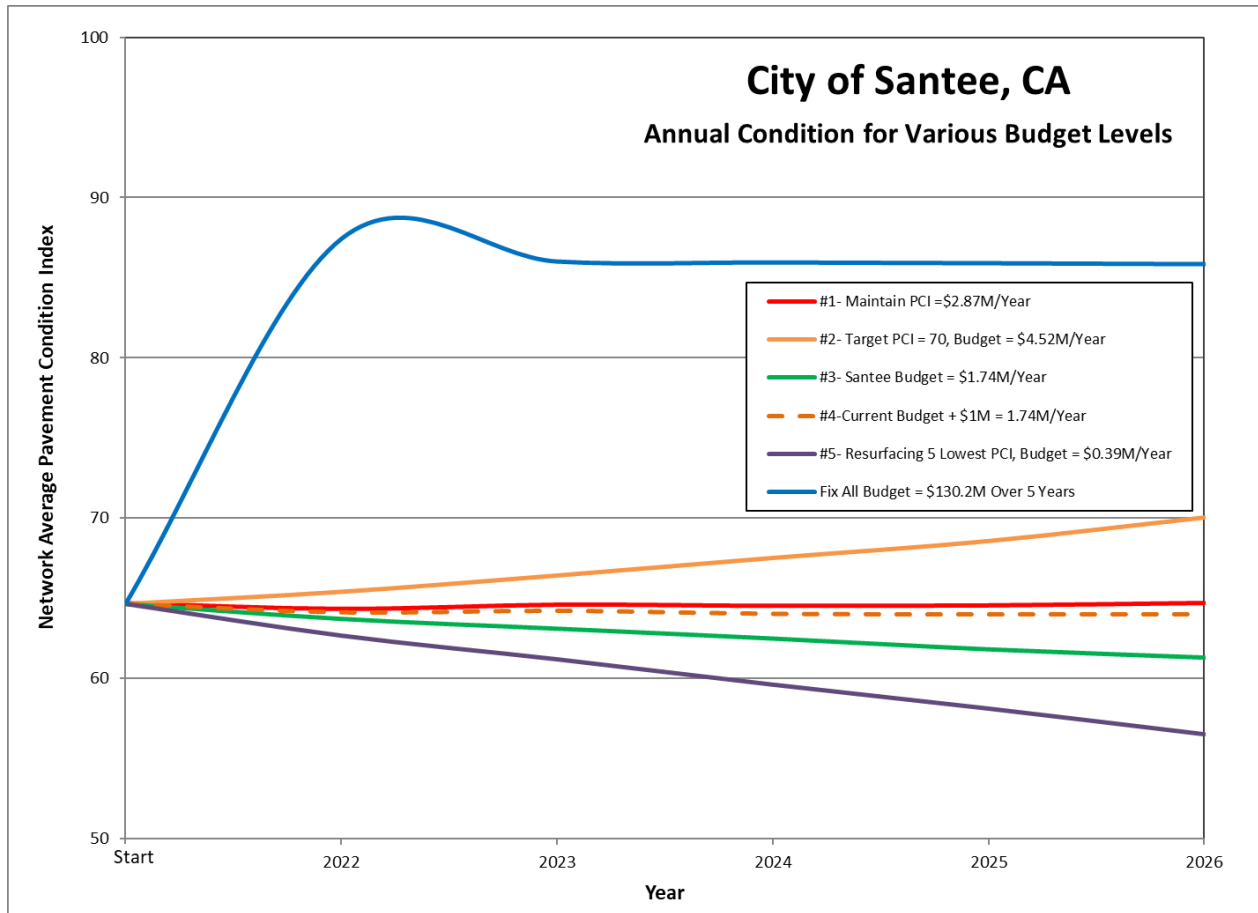

Figure 2 – Effect of Budget on Overall Roadway Pavement Conditions

For more information on budgets please see [Section 5.3](#).

Finally, the pavement management program was used to formulate practical projects for the City with five unique budgets (identified in section 5). The 5-year recommended M&R plan color-coded by activity and year is provided in the appended maps to the report.

The analysis and data presented in this report are based on the inspections performed by IMS in September 2021 on the City's pavement network, available work history, and other assumptions elaborated in the report. The information presented in the Executive Summary is summarized from various sections of this report. It is essential that reviewers familiarize themselves with detailed information provided in subsequent sections of this report prior to making any specific decisions based on these results.

2.0 PRINCIPLES OF PAVEMENT MANAGEMENT

2.1 Foreword

This section will cover the basics of pavement management, discussing both the purpose of pavement management as well as the M&R philosophy that is a widely agreed on best practice in the industry. The goal of this pavement management philosophy is to perform preventative maintenance on streets before they cross a threshold where more expensive rehabilitation activities are needed. A successful pavement management program in a municipality can provide many economic and social benefits to the community. This section will provide models of the pavement life cycle as well as references that highlight the socioeconomic advantages of a well-maintained pavement network.

2.2 Pavement Preservation

Preservation of existing roads and street systems has become a major activity for all levels of government. Municipalities must consistently optimize and plan for the spending of their budgets, ensuring that funds designated to pavement M&R are used as effectively as possible. Municipalities must also identify the optimum level of long-term funding required to sustain the network at a predetermined level of service considering the local conditions and constraints.

The best method to obtain the most optimal usage of available funds or to determine the required funding to achieve a predetermined level of service is through the use of a pavement management system. An effective pavement management system can assist agencies in developing long-term rehabilitation programs and budgets, assess the effectiveness of maintenance activities and new technologies, and store historical data and images.

Pavement management is the process of planning, budgeting, designing, evaluating, and rehabilitating a pavement network to preserve the existing roadway structure in a serviceable manner.

Figure 3 illustrates that, typically, pavements start deteriorating rapidly once they hit a specific threshold. A nominal investment in cheaper surface treatments at 40% lifespan is much more effective than deferring maintenance until heavier overlays or possibly reconstruction is required just a few years later. Streets that are repaired while in good condition will have an extended lifetime and will cost less over their lifetime than those left to deteriorate to a poor condition. Without an adequate routine pavement maintenance program, streets will require more frequent reconstruction, thereby costing millions of extra dollars.

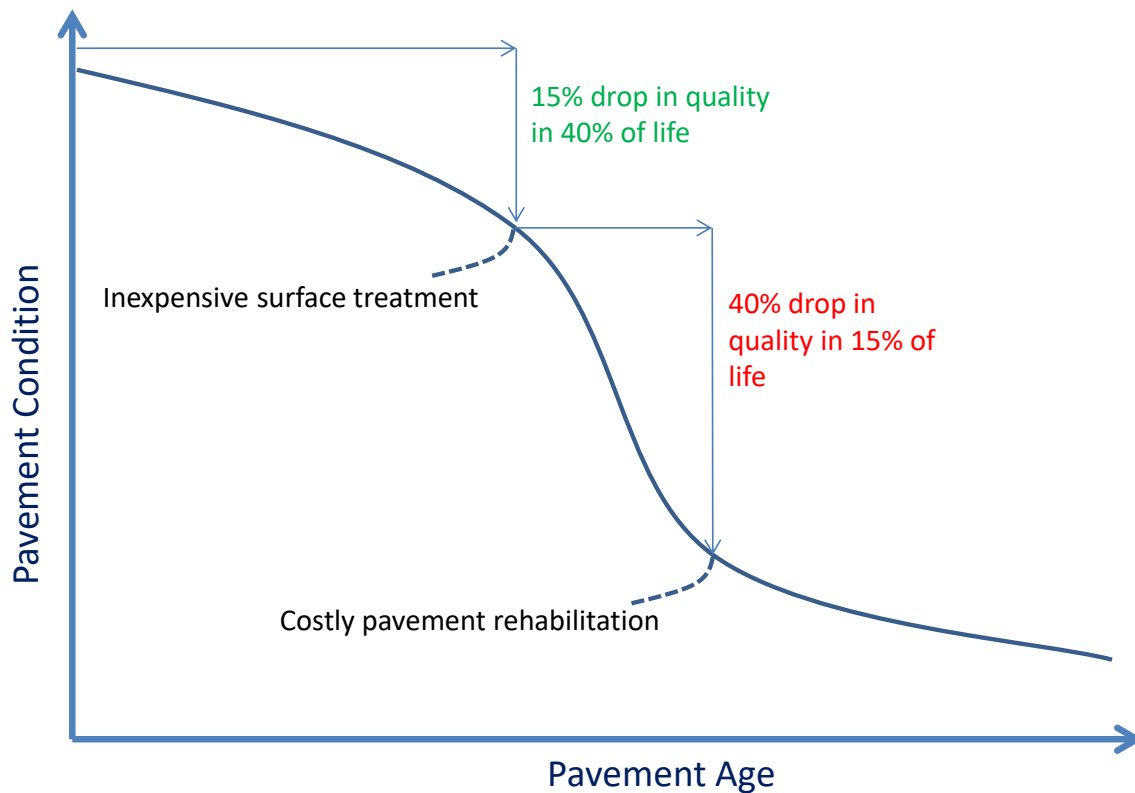

Figure 3 – Pavement Deterioration and Life Cycle Costs

The goal of the pavement management program is to develop policies and practices to delay the inevitable total reconstruction for as long as practical through application of routine M&R strategies while pavements are within the target zone of cost-effective pavement preservation. That is, as each roadway approaches the steepest part of its deterioration curve, apply a surface treatment that extends the pavement life, at a minimum cost, avoiding costly heavy overlays and reconstruction down the line.

The key to a successful pavement management program is to develop a reasonably accurate deterioration curve of the pavements, and then identify the optimal timing and rehabilitation strategy. The outcome of this exercise is the long-term cost savings and increase in network level pavement quality over time. **Figure 4** illustrates the concept of extending pavement life through the application of timely M&R activities.

A successful pavement management program requires periodic updates in pavement conditions, deterioration models, and cost models, and evaluation of the effectiveness of M&R activities.

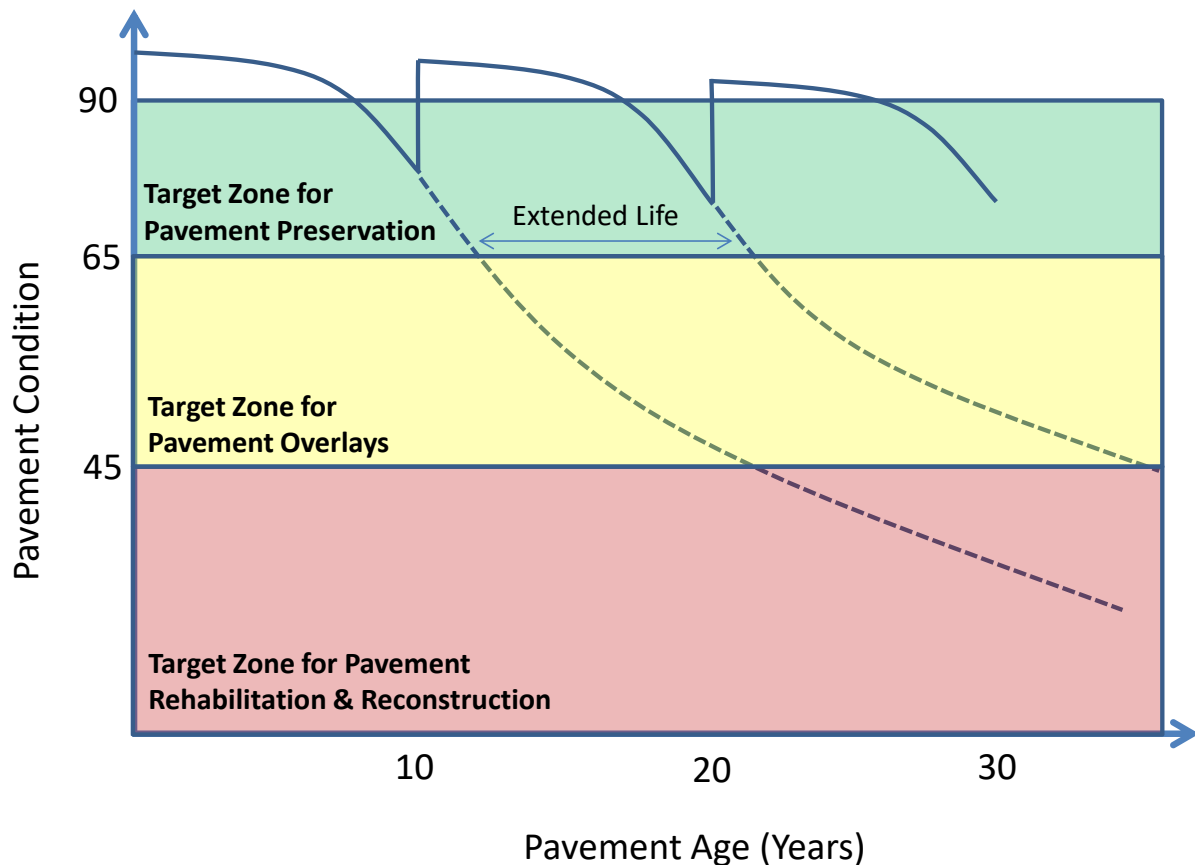

Figure 4 - Pavement Life Cycle Curve

2.3 Economic Impacts of Maintenance and Rehabilitation

The role of the street network as a factor in the City's well-being cannot be overstated. In simplest of terms, roadways form the economic backbone of a community. They provide the means for goods to be exchanged, commerce to flourish, and commercial enterprises to generate revenue. As such, they are an investment to be maintained.

The overall condition of an agency's infrastructure and transportation network is a key indicator of economic prosperity. Roadway networks in general are one of the most important and dynamic sectors in the global economy, having a strong influence on not only the economic well-being of a community, but a strong impact on quality of life. Well-maintained road networks experience multiple socioeconomic benefits through greater labor market opportunities and decreasing income gap. As a crucial link between producers and their

markets, quality road networks ensure straightforward access to goods and drive global and local economies. Likewise, higher network quality has a strong correlation to improvements in household consumption and income. Roads also act as a key element to social cohesion by acting as a median for integration of bordering regions (Gertler, 2016¹). This social integration promotes a decreased gap in income along with diversity and a greater sense of community that can play a large role in decreasing rates of poverty.

Conversely, deterioration of roads can have adverse effects on a community and may bring about important and unanticipated welfare effects that the governments should be aware of when cutting transportation budgets (Gertler, 2016). Poor road conditions increase fuel and tire consumption while shortening intervals between vehicle repair and maintenance. In turn, these roads result in delayed or more expensive deliveries for businesses and consumers. Economic effects of poor road networks, such as time consuming and costly rehabilitation, can be reduced if a proactive maintenance approach is successfully implemented.

The primary concern for the long-term health of the Santee roadway network from a pavement management perspective is to improve the current network profile in two key areas – that is reducing the number of streets rated at a PCI of 40 or below, while simultaneously preventing any further slide in PCI at the higher end of the scale. This requires a two-pronged approach to pavement management in that the City must be continually working on preserving streets with high condition scores to prevent them from dropping into heavier rehabilitation categories, while at the same time be judicious in selecting specific streets for rehabilitation before they become total reconstructs, which is more costly.

2.4 Summary

The goal of the pavement management program is to delay the inevitable total reconstruction for as long as practical through application of routine M&R strategies. The outcome of this exercise is the long-term cost savings and increase in network level pavement quality over time. Effective implementation of a pavement management program can result in positive socioeconomic benefits to the community.

3.0 THE PAVEMENT MANAGEMENT PROCESS

3.1 Foreword

This section reviews the process and standards that were followed to satisfy the scope of this project. The section provides a summary of the pavement management system that was implemented in the City, as well as a review of the technology that was mobilized by IMS to collect pavement condition data. Following a summary of each pavement distress, this section will outline the formulas used in the pavement management system to calculate an overall PCI score for each pavement segment.

3.2 IMS Pavement Management Process Overview

IMS Infrastructure Management Services, LLC (IMS) was contracted by The City of Santee (City) to conduct a comprehensive pavement condition assessment and pavement management analysis on City's roadway network. The objectives of this project were to: (1) perform a network-level condition survey of the City's roadways with 2-passes on all non-residential streets and 1-pass on residential streets, (2) provide City staff with an update to their pavement management system, (3) estimate the rate of deterioration of the City's pavements, and (4) estimate the future Maintenance and Rehabilitation (M&R) requirements for the City's pavement infrastructure.

As shown in **Figure 5**, the IMS Laser Road Surface Tester (RST) was mobilized to Santee to conduct an objective survey and to collect pavement imagery, roadway geometry, longitudinal and transverse profile, and surface distress data.

The collected pavement imagery, and surface distress data were analyzed following the *ASTM D6433* to determine the Surface Distress Index (SDI). The pavement longitudinal profile data was also analyzed based on *ASTM E1926* to assess its roughness through determination of the International Roughness Index (IRI). The analyzed data was used to determine the Pavement Conditions Index (PCI) score for each block of the road.

Following the pavement condition assessment, the pavement management system was implemented and updated with the latest inventory and condition data. It was used to run several "What-If" scenarios to depict the consequence of different funding levels as well as the outcome of the City's current funding on street network conditions.

Figure 5 – Laser Road Surface Tester (RST)

3.3 ESA Pavement Management System

Easy Street Analysis (ESA), a proprietary spreadsheet-based software alternative. ESA is flexible, in a familiar format, designed by pavement engineers, and populated with a full suite of visual presentation material. A custom script allows updated information in ESA to be seamlessly populated to the City's GIS. The system provides a suite of pavement management tools that will help the City with the following tasks:

- Developing and organizing their pavement inventory.
- Assessing the current condition of their pavements.
- Developing models to predict future pavement conditions.
- Reporting on future pavement performance.
- Developing scenarios for M&R based on either funding or pavement condition goals.
- Planning M&R projects.

3.4 Pavement Condition Survey

One of the primary objectives of this project was to perform a comprehensive pavement condition survey on the City's roadway network and perform an imagery-based PCI survey on the collected data using the guidelines presented in ASTM D6433.

A specialized piece of survey equipment – referred to as the Laser Road Surface Tester (RST) – was used to collect observations on the condition of the pavement surface, as well as to collect high-definition digital imagery and spatial coordinate information. The RST is equipped with the second edition of 3D Laser Crack Measurement System (LCMS-2) and provides a continuous scan of a 4m wide lane width (shown in **Figure 6**) with 1mm resolution and can operate at speeds up to 60-mph.

The LCMS system allows for automated detection of pavement distresses including various types of cracks, raveling, edge drop-offs, potholes, macrotexture, and rutting. The system also automatically determines the presence of paint stripes which help in identifying the pavement lane.

Data collection was performed during daytime and only during dry weather conditions. Data collection was performed while observing all traffic rules and at posted speed limits.

Figure 6 – RST Equipped with the 3D LCMS-2 Camera

3.5 Pavement Condition Data Analysis

Surface Distress Index (SDI) – The Laser RST collects surface distress observations based on the extent and severity of distresses encountered along the length of the roadway following ASTM D6433 protocols for asphalt and concrete pavements. The surface distress condition (cracking, potholes, raveling) is considered by the traveling public to be the most important aspect in assessing the overall pavement condition.

Presented on a 0 to 100 scale, the Surface Distress Index (SDI) is an aggregation of the observed pavement defects. Within the SDI, not all distresses are weighted equally. Certain load associated distresses (caused by traffic loading), such as rutting or alligator cracking on asphalt streets, or divided slab on concrete streets, have a much higher impact on the surface distress index than non-load associated distresses such as raveling or patching. Even at low extents and moderate severity – less than 10% of the total area – these distresses can drop the SDI considerably. ASTM D6433 also has algorithms within it to correct for multiple or overlapping distresses within a segment.

The following provides a description of major distress types identified in the network:

Alligator Cracking – Quantified by the severity of the failure and number of square feet. As a load associated distress, this distress has a significant impact on the condition score, even at low extents.

Wheel Path Rutting – Starting at a minimum depth of ¼ inch, wheel path ruts are quantified by their depth and the number of square feet encountered. Like alligator cracking, low densities of rutting can have a large impact on the final condition score.

Longitudinal & Transverse Cracks – Quantified by their length and width. These cracks can be the result of pavement shrinkage, or construction issues.

Block Cracking – Quantified by their width and number of square feet, these cracks form by interconnected longitudinal and transverse cracks that divide the pavement into approximately rectangular pieces.

Patching – Quantified by the extent and quality of patches. Even a good quality patch is considered a surface defect and affects the conditions.

Raveling – Loss of course aggregate materials on the pavement surface and is measured by the severity and number of square feet affected.

Bleeding – the presence of free asphalt on the roadway surface caused by too much asphalt in the pavement or insufficient voids in the matrix. The result is a pavement surface with low skid resistance. This distress is measured by the amount and severity of the area.

Edge Cracking – Running parallel to the road and usually within 1 to 2 feet of the outer edge of the pavement, this distress is accelerated by traffic loading and weakened base conditions resulting from poor drainage.

Pothole – Small bowl-shaped depressions in the pavement surface and measured by the severity and the number of occurrences.

Distortion – Includes various localized unevenness in the surface of the pavement including bumps and sags, depressions, swell, corrugation or shoving.

SDI = 100 – Sum of Distress Deducts

Roughness Index (RI) – Roughness is recorded following ASTM E1926 “International Roughness Index” (IRI), a measure of the change in elevation over a distance expressed as a slope and reported in millimeters/meter. The IRI value is converted to a 0 to 100 score and reported as the Roughness Index (RI). Roughness is a key indicator pavement deterioration as well as representing the public’s perception of ride quality.

$$RI = (11 - 3.5 \times \ln (IRI)) \times 10$$

Structural Index (SI) –The Santee roadways were not tested for structural adequacy, instead the relationship between the pavement condition score and the sum of load associated distress deducts (LADD) was analyzed and each pavement section was assigned a 'Weak', 'Moderate' or 'Strong' strength rating and an SI of 30, 60, or 80, respectively.

The assigned SI was not used in determining the overall PCI score, but simply to classify the pavement strength and aid in selecting appropriate rehabilitation strategies.

Pavement Condition Index (PCI) – Following our field surveys, the condition data was imported to ESA for calculating the overall PCI.

PCI Calculations:

$$PCI = 67\% SDI + 33\% RI$$

The 0 to 100 PCI range is commonly divided into various ranges using descriptive terms. Divisions between the terms are not fixed but are meant to reflect common perceptions of pavement conditions **Figure 7** and **Table 1** detail a general description for each of these condition ranges with respect to remaining life and typical rehabilitation actions.

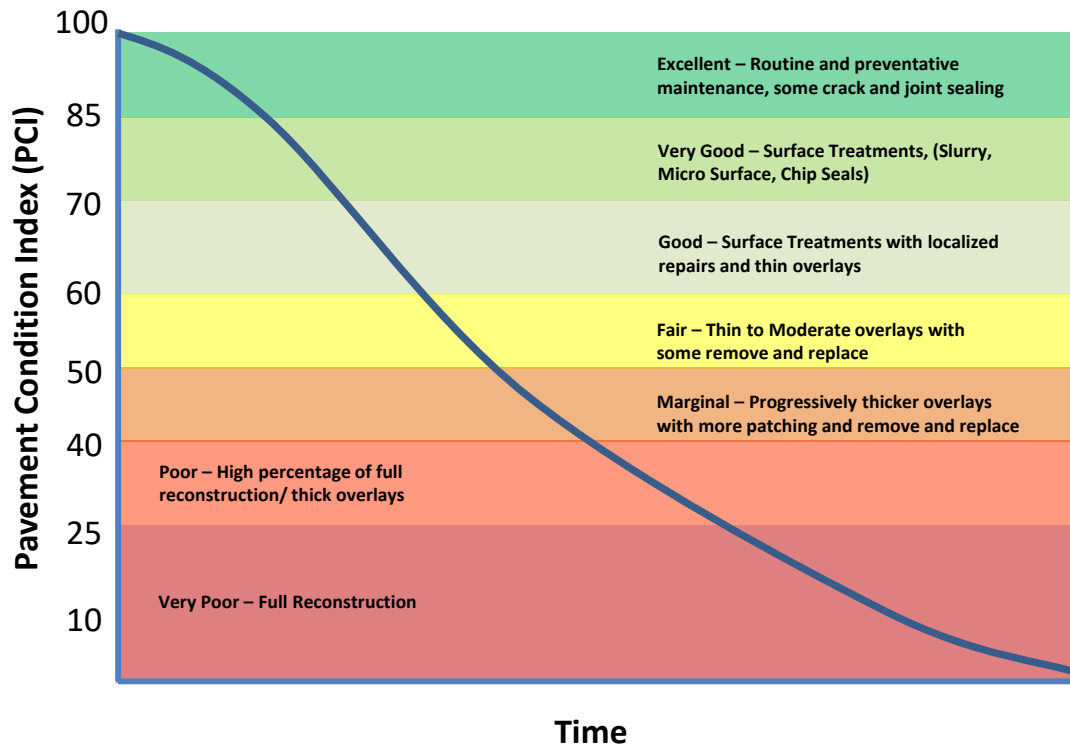

Figure 7 – Understanding the Pavement Condition Index (PCI) Score

Table 1 – Pavement Condition Ranges

PCI Range	Description	Relative Remaining Life	Definition
85 – 100	Excellent	15 to 25 Years	Like new condition – little to no maintenance required when new; routine maintenance such as crack and joint sealing.
70 – 85	Very Good	12 to 20 Years	Routine maintenance such as patching and crack sealing with surface treatments such as slurry sealing.
60 – 70	Good	10 to 15 Years	Heavier surface treatments, cape seals and thin overlays.
40 – 60	Marginal to Fair	7 to 12 Years	Heavy surface-based inlays or overlays with localized repairs.
25 – 40	Poor	5 to 10 Years	Sections will require very thick overlays, surface replacement, base reconstruction, and possible subgrade stabilization.
0 – 25	Very Poor	0 to 5 Years	High percentage of full reconstruction.

3.6 Summary

This section reviewed the scope and standards used in this project. The LCMS-2 technology was mobilized to collect pavement condition information, including roughness and surface distresses. Pavement condition data was then loaded into the ESA Pavement Management System and through a series of calculations (outlined in 3.5) an accurate PCI was determined for each pavement segment. ESA used this data to develop pavement deterioration models and M&R recommendations. **Using the approach described in this section the Santee Network average PCI was determined to be a 65.**

4.0 PAVEMENT CONDITION SURVEY RESULTS

4.1 Foreword

This section will review the results of the pavement condition survey performed in September 2021. First is a summary of conditions in the six functional classes used in the Santee analysis. Next, this section will review photos of the network taken from the RST. Finally, a series of charts and maps will summarize the findings of the condition survey and the overall PCI distribution of the Santee pavement network. A summary of the Santee network conditions is contained in this section.

A summary of the section is available in [Section 4.7](#)

4.2 Santee Street Inventory and Condition Summary

The paved roadway network covers approximately 126 centerline miles of asphalt pavements.

As part of the scope of this assignment, the functional classification designations currently used by the City were adopted for their use in the pavement analysis. The City currently consists of six classes: Prime / Major Arterial, Major / Industrial Collector, Residential and Parkway.

Although there is no uniform standard for classifying pavement into functional classes, The Federal Highway Administration (FHWA), American Public Works Association (APWA) and Institute of Transportation Engineers (ITE) offer some broad guidelines on how to assign classifications that were considered in this study.

1. **Prime Arterial (PART)** – are six lanes or larger divided roadways with raised, landscaped medians to control turning movements that cross other arterials at grade with signalized intersections. Prime Arterials also have an increased landscaped parkway width between the right-of-way and curb.
2. **Major Arterial (MART)** – are four to six lane divided roadways with landscaped raised medians to control turning movements and that cross other arterials at grade with signalized intersections.
3. **Major Collector (MCOL)** – are feeder or connector roadways that complement the arterial network, but are of lesser capacity, with two or four lanes and striped turning lanes. Collectors typically have signalized or “Stop” sign control at intersections with other circulation element streets.
4. **Industrial Collector (ICOL)** – these are the street segments are slightly larger local roadways to accommodate commercial vehicles safely in areas of industrial development.
5. **Residential** – These are the street segments consisting of all residential roads.
6. **Parkway** – Rural highway connecting the Santee network to City limits

Table 2 presents Santee’s inventory and pavement condition breakdown between different functional classes. An electronic version of this map is appended to this report. **Appendix A** provides detailed inventory and condition data the Santee network.

Table 2 - Network Inventory Summary by Functional Class

City of Santee, CA

Network Summary by Functional Class

	Pavetype	Total Network	Prime Arterial	Major Arterial	Major Collector	Industrial Collector	Residential	Parkway
Segment (Block) Count	All Streets	1514	35	144	162	30	1130	13
	Asphalt	1513	35	144	162	30	1129	13
	Concrete	1	0	0	0	0	1	0
Network Length (ft):	All Streets	663,953	15,170	66,620	64,450	16,116	479,483	22,113
	Asphalt	663,718	15,170	66,620	64,450	16,116	479,248	22,113
	Concrete	235	0	0	0	0	235	0

	Concrete	0.0	0.0	0.0	0.0	0.0	0.0	0.0
Average Width (ft):	All Streets	43.7	87.9	76.2	57.4	46.0	35.7	46.7
	Asphalt	43.6	87.9	76.2	57.4	46.0	35.7	46.7
	Concrete	65.1	0.0	0.0	0.0	0.0	65.1	0.0
Network Area (ft2):	All Streets	28,985,151	1,333,725	5,074,413	3,699,278	741,020	17,104,397	1,032,318
	Asphalt	28,969,852	1,333,725	5,074,413	3,699,278	741,020	17,089,098	1,032,318
	Concrete	15,299	0	0	0	0	15,299	0
Pavement Condition Index (PCI)	All Streets	64	54	64	55	49	67	73
	Asphalt	64	54	64	55	49	67	73
	Concrete	53	0	0	0	0	53	0
Backlog (%)	All Streets	11	Percentage of Network with a PCI < 40					

The City of Santee consists of 6 unique functional classes. The following graph **Figure 8** shows the PCI breakdown of each of the 6 classes. The **Residential network has an average PCI of 66** and makes up the majority of the Santee pavement network (91 miles). **The remaining 28 miles have an average PCI of 60.** This average is brought down by the deteriorated quality of the collector streets which make up only 15 centerline miles of the total network (12% of the total network). Each functional class and its respective PCI is outlined in both **Table 2** and **Table 3**.

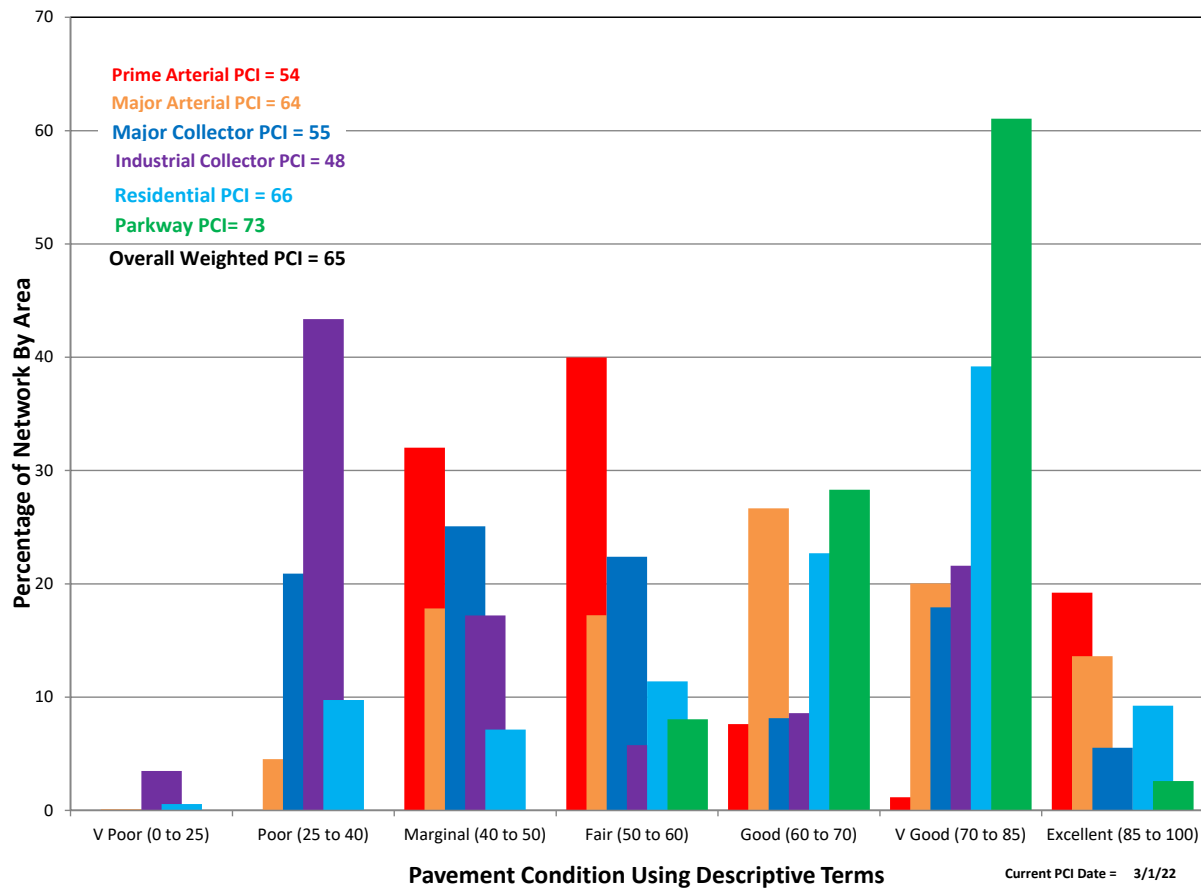

Figure 8 – Condition by Functional Class

A partial review of the condition data was completed by an independent third party, Quality Engineering Solutions (QES), using the LCMS laser data and 4k images collected during the survey. Conditions were found to be consistent between assessments with only minor discrepancies showing up on a few sections. The discrepancies were deemed random by QES with the majority of the data confirmed as accurate and representative of the actual pavement condition. The details of this report can be found in **Appendix F**.

Table 3 – Functional Class Average PCI

Functional Class	Average Weighted PCI
Prime Arterial	54
Major Arterial	64
Major Collector	55
Industrial Collector	49
Residential	67
Parkway	73

4.3 Santee Network Condition Imagery

The images presented below provide a sampling of the Santee streets that fall into the various condition categories with a discussion of potential rehabilitation strategies.

Very Poor (PCI = 0 to 25) – Complete Reconstruction

(Approx. 1% of City Streets)

Railroad Avenue from City Limit to Prospect Avenue (GISID 1521, PCI = 18) – Rated as Very Poor, this street displays spreading base failure as evidenced by the severe alligator cracking. An overlay on this street would not be suitable as the base has failed and would not meet an extended service life of at least 15 years. This street requires a partial or full reconstruction and should be carefully monitored.

Deferral of reconstruction of streets rated as Very Poor will not cause a substantial decrease in pavement quality as the streets have passed the opportunity for overlay-based strategies. Due to the high cost of reconstruction, Very Poor streets are often deferred in favor of completing more streets that can be rehabilitated at lower costs, resulting in a greater net benefit to the City. This strategy however must be sensitive to citizen complaints forcing the street to be selected earlier. In addition, this type of street can pose a safety hazard for motorists since severe potholes and distortions may develop. It is important to consistently monitor these streets and check for potholes or other structural deficiencies until the street is eventually rebuilt.

Recommended Treatment: Remove & Replace

Estimated Cost per Square Foot (\$/SF): \$8.00

Poor (PCI = 25 to 40) – Overlay

(Approx. 10% of City Streets)

De Vos Drive from Heiting Way to Van Andel Way (GISID 1845, PCI = 29) – Rated as Poor, this segment still has some remaining life before it becomes a critical reconstruction need. As evident in the imagery, the full length of the segment is severely alligator cracked. If left untreated, within a short period of time potholes will become prevalent.

On heavy traffic roadways, Poor streets often require partial to full reconstruction – that is removal of the pavement surface and base down to the subgrade and rebuilding from there. On local roadways, they require removal of the pavement surface through grinding or excavation, base repairs, restoration of the curb line and drainage, and then placement of a new surface.

In general, the service life of Poor streets is such that if deferred for too long, it would require a more costly reconstruction. Streets rated as Poor are typically selected first for rehabilitation as they provide the greatest cost/benefit to the City – that is the greatest increase in life per rehabilitation dollar spent.

Recommended Treatment: 2" Overlay

Estimated Cost per Square Feet (\$/SF): \$2.50–\$3.00

Marginal (PCI = 40 to 50) –Overlay

(Approx. 13% of City Streets)

Sunwood Drive from Gorge Avenue to Willowgrove Avenue (GISID 2315, PCI = 45) – Marginal streets have distresses that tend to be localized and moderate in nature – that is they do not extend the full length of the segment. On this segment the evidence of deterioration is the moderate linear cracking which can be clearly seen in the image above. Many of the cracks have been previously sealed, however additional cracks are forming in the surrounding areas.

Marginal streets that display high amounts of load associated distresses are selected as a priority for rehabilitation as they provide the greatest cost/benefit to the City. If left untreated, Marginal streets with high amounts of LADD would deteriorate to become partial reconstruction candidates. Marginal streets that are failing due to materials issues or non-load associated failures may become suitable candidates for thick overlays if deferred, without a significant cost increase.

Recommended Treatment: 2" Overlay

Estimated cost per Square Foot (\$SF): \$2.50–\$3.00

Fair (PCI = 50 to 60) – Cape Seal

(Approx. 14% of City Streets)

Pennywood Road from Hirsch Road to Vomac Road (GISID 2211, PCI = 55) – Several distresses are present, but tend to be more localized and moderate in severity, and non-load related (primarily linear cracking).

Recommended Treatment: Cape Seal

Estimated cost per Square Foot (\$/SF): \$1.75

Good (PCI = 60 to 70) – Cape Seal

(Approx. 21% of City Streets)

Mirador Street from Calico Street to Ruocco Drive (GISID 2291, PCI = 65) – Rated as Good with the primary cause of deterioration the transverse and longitudinal cracking. It also displays small amounts of load associated distresses that can easily be removed to restore the visual appearance of the roadway. The existing cracks have been sealed and the pavement surface could be restored further with a heavier surface treatment such as microsurfacing to fully waterproof the pavement and cover the crack sealant.

Recommended Treatment: Cape Seal

Estimated cost per Square Foot (\$/SF): \$1.75

Very Good (PCI = 70 to 85) – Slurry Seal

(Approx. 33% of City Streets)

Ramsgate Drive from Notnil Court to Kenesaw Court (GISID 1415, PCI = 75) – Rated as Very Good, this road displays minor amounts of linear cracking. This street is an example of a candidate for preventative maintenance such as slurry sealing to extend the life of a roadway.

Routine maintenance such as crack sealing and joint sealing and localized patching allows for keeping the cracks as waterproof as possible. By keeping water out of the base layers, the pavement life is extended without the need for heavier rehabilitations.

Recommended Treatment: Slurry Seal

Estimated cost per Square Foot (\$/SF): \$0.40–\$1.25

Excellent (PCI = 85 to 100) – Routine Maintenance
(Approx. 8% of City Streets)

Woodpecker Way from Sunridge Drive to Matterhorn Drive (GISID 2387, PCI = 96) – Rated as Excellent, displaying little to no surface distresses. The ride is smooth and the surface and the base is strong.

Recommended Treatment: Routine Maintenance

Estimated cost per Square Foot (\$/SF): \$0.40 or less

4.4 Santee Network Condition Distribution

The following graph (**Figure 9**) plots the same pavement condition information, but instead of using the actual PCI value, descriptive terms are used to classify the roadways.

- **Eight percent (8%)** of the network is rated as Excellent condition and require only routine maintenance.
- **Thirty-three percent (33%)** of the network is rated as Very Good condition. These are roads that benefit most from preventative maintenance techniques such as microsurfacing, slurry seals and localized patching.
- **Twenty-two percent (22%)** of the streets are rated as Good condition and are candidates for lighter surface-based rehabilitations such as thin overlays or slight panel replacements.
- **Twenty-six percent (26%)** of network is rated as Fair to Marginal condition representing candidates for progressively thicker overlay-based rehabilitation or panel replacements. If left untreated, they will decline rapidly into reconstruction candidates.
- The remaining **eleven percent (11%)** of the network is rated as Poor or Very Poor condition, meaning these roadways have failed or are past their optimal due point for overlay or surface-based rehabilitation and may require progressively heavier forms of rehabilitation.

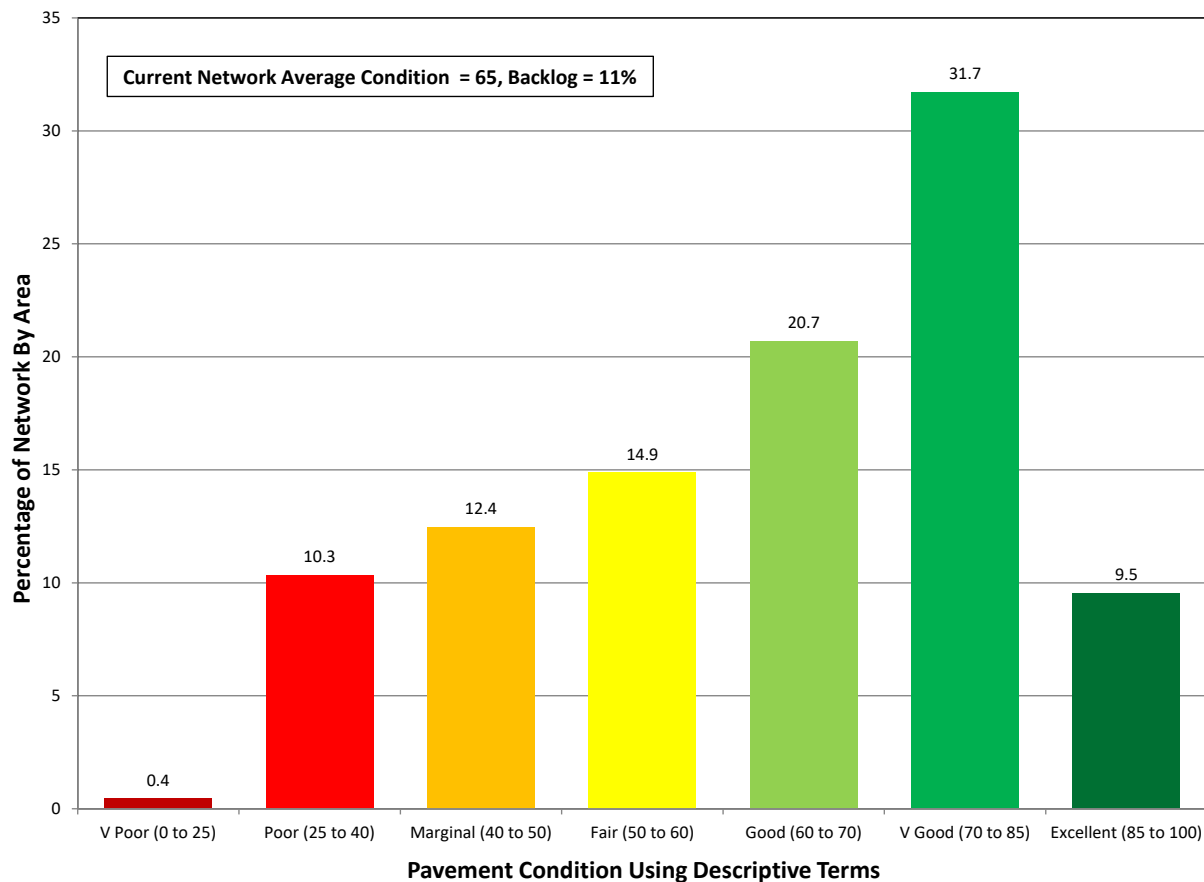

Figure 9 – Roadway Network Present Status Using Descriptive Terms

4.7 Summary

Section 4 reviewed the results of the condition survey in Santee. The section described each of the six functional classifications in the City and outlined their respective conditions on the GFP scale. The GFP scale was explained further through a series of pavement photographs that were taken during the 2021 survey. The section includes a discussion on the overall pavement condition distribution in Santee and some useful charts and maps that help put the survey results into perspective. **The network average PCI in Santee is a 65 with a backlog of 11%.**

5.0 REHABILITATION PLAN AND BUDGET DEVELOPMENT

5.1 Foreword

This section discusses the results of the pavement management analysis that was performed using the ESA pavement management system. First is an overview of the assumptions that were used when implementing the system. Some of these include the development of accurate unit rates, and the selection methodology for rehabilitation candidates. Next, in 5.2, the results of each of the various budget runs is detailed, along with their resulting conditions. This is highlighted further through a series of charts that are used to demonstrate the positives and negatives of various funding models. Finally, the City's selected budget is presented through a map and chart outlining the 5-year anticipated condition.

5.2 Key Analysis Set Points and Assumptions

Pavement management analysis requires user inputs to complete its condition forecasting and prioritization. A series of operating parameters were developed to create an efficient program that is tailored to the City's needs.

Rehabilitation Strategies and Unit Rates

The rehab strategies and unit rates used in the pavement analysis can be found on the following page in **Table 6**. Some important parameters include:

- **Rehab Activity** – The assigned identifier and name to each rehabilitation strategy. Various degrees of chip sealing are outlined to highlight the increasing cost associated with sealing larger extents of pavement.

The recommended rehab activities for any given PCI range may vary based on pavement strength and functional classification.
- **Unit Rates** – The rehab costs are presented on a per square foot basis for each pavement type, functional class, and rehabilitation activity combination. IMS worked closely with the City to determine rates that accurately represent the cost of doing work.
- **Critical PCI** – The Critical PCI defines when a group is in its need year and is deemed to be critical, otherwise if deferred, the street or zone declines in PCI past the point which the rehabilitation is ideal.
- **Selection and Prioritization of Rehab Candidates** – The City's pavement management program incorporates a series of user defined values to prioritize and select the street segments for rehabilitation. The rehab selection order is not worst first, but rather designed to capture as many segments in their need year based on the incremental cost of rehab deferral. A street is considered to be in its need year when it has reached its maximum service life and any further deferral would require a heavier and more costly rehabilitation. The rehab program has been designed to maximize the increased service life for each rehabilitation dollar spent on a segment for non-residentials and at the zone level for residentials.

The unit rates are reflected in the network value and final budgets for doing work in Santee.

Table 6 – Rehabilitation Rates

City of Santee, CA

Rehabilitation Strategies and Unit Rates

Pavetype	Rehab Code	Rehab Activity	Min PCI	Critical PCI (Need Year)	Max PCI	Prime Arterial Unit Rate (\$/ft2)	Major Arterial Unit Rate (\$/ft2)	Major Collector Unit Rate (\$/ft2)	Industrial Collector Unit Rate (\$/ft2)	Residential Unit Rate (\$/ft2)	Parkway Unit Rate (\$/ft2)
Asphalt	10	Slurry Seal	80	100	100	1.25	1.25	1.25	1.25	0.40	0.40
Asphalt	23	Cape Seal	50	52	70	1.75	1.75	1.75	1.75	1.75	1.75
Asphalt	40	Moderate Overlay (2")	20	25	50	3.00	3.00	3.00	3.00	2.50	2.50
Asphalt	70	ACP Full Depth R&R	0	10	20	8.00	8.00	8.00	8.00	8.00	8.00

Other factors included in the prioritization process focus on:

- **Need Year** – streets are only selected when they have expended their service life and are optimal for rehab selection.
- **Functional Classification** – generally priority is given to higher functional classifications as they provide greater benefits to a larger group of users.
- **Pavement Strength** – weaker streets are prioritized higher than stronger ones as they deteriorate faster.
- **Area** – a very slight increase in priority is given to larger projects over smaller ones.

In Santee, the M&R strategy revolves around strategic use of four primary pavement treatments.

1. **Slurry seal** is applied to help preserve and protect the underlying pavement structure and provide a new driving surface. Roads chosen for slurry seal applications generally have low to moderate distress and narrow crack width.
2. **Cape Seal** is an application of chip seal followed with a slurry seal or in some cases a microsurfacing. The benefits from using a cape seal include a very smooth surface with an increased durability by sealing and bonding cracks.
3. **Overlay** is the most cost effective of the rehabilitation techniques. To be a candidate for an overlay, pavement should be relatively sound without large areas of base failure. Overlays range from 1.5" to 2" thickness and are used to address roads with a PCI of 20 all the way to 50. Typically, residential streets receive 1.5" overalys while other functional classes utilize a minimum of 2" thick overlays. Additional full depth patching is likely.
4. **Full Depth Remove and Replace (R&R)** is the last resort for pavements that are past the point where overlays and base patching are effective. These streets generally show signs of full width pavement failure and may include areas of missing pavement. While this is the most expensing treatment options, it will provide for the longest.

Table 7 below shows the overlay vs surface treatment cost breakdown between Major and Minor streets. The table presents all 5-years of the analysis based on the City's current approved budget. Additional details are provided in the following section.

Table 7 – 5-year Overlay and Surface Treatment Cost Summary

Year	Minors			Majors			Santee Network	
	Surf Trtmnt	Overlays	Total	Surf Trtmnt	Overlays	Total	Program Total	Santee Budget
2022	\$80,337	\$1,546,806	\$1,627,143	\$0	\$0	\$0	\$1,627,143	\$1,629,000
2023	\$671,497	\$142,643	\$814,140	\$0	\$861,948	\$861,948	\$1,676,088	\$1,680,000
2024	\$33,644	\$0	\$33,644	\$658,306	\$1,036,614	\$1,694,920	\$1,728,564	\$1,733,000

2026	\$0	\$1,026,001	\$1,026,001	\$686,260	\$0	\$686,260	\$1,712,261	\$1,847,000
	\$1,463,347	\$2,715,450	\$4,178,797	\$1,344,566	\$2,945,157	\$4,289,723	\$8,468,520	\$8,678,000

5.3 Network Budget Analysis Models

An analysis containing a total of 5 profile budget runs was prepared for Santee. All budgets take effect over a 5-year period. The analysis results are summarized below:

1. **Maintain PCI** – this is simply the funds required to maintain the current network average PCI at a 65. The annual budget required to do so is on the order of \$2.87M annually. The backlog (Very Poor & Poor roadways) will grow to 19% under this plan.
2. **Target PCI 70** – This budget targets a level-of-service goal with a PCI of 70. The annual cost to achieve this target PCI is approximately \$4.52M annually over the 5-year budget.
3. **Santee Budget** (Green Line) – This represents the City's current average annual budget of \$1.74M/yr dedicated to pavement preservation and rehabilitation. This level of funding will result in a network average PCI score of 57 and a backlog of 21%.
4. **Santee + \$1M** – This model presents the anticipated conditions if the current annual budget of \$1.74M was boosted by an additional \$1M annually. This results in a PCI of 64 with a backlog approaching 23%.
5. **5 Lowest PCI** – This unique funding model attempts to rehabilitate 5 streets each year with the lowest PCI. The budget needed to complete this is approximately \$390,000 annually and will result in a PCI of 57 with a backlog of 25%.

The results of the analysis are summarized in **Figure 10**. The X-axis highlights the annual budget, while the Y-axis plots the 5 Year Post Rehab Network Average PCI value. The diagonal blue line is the results of the pavement analysis (the Santee model profile).

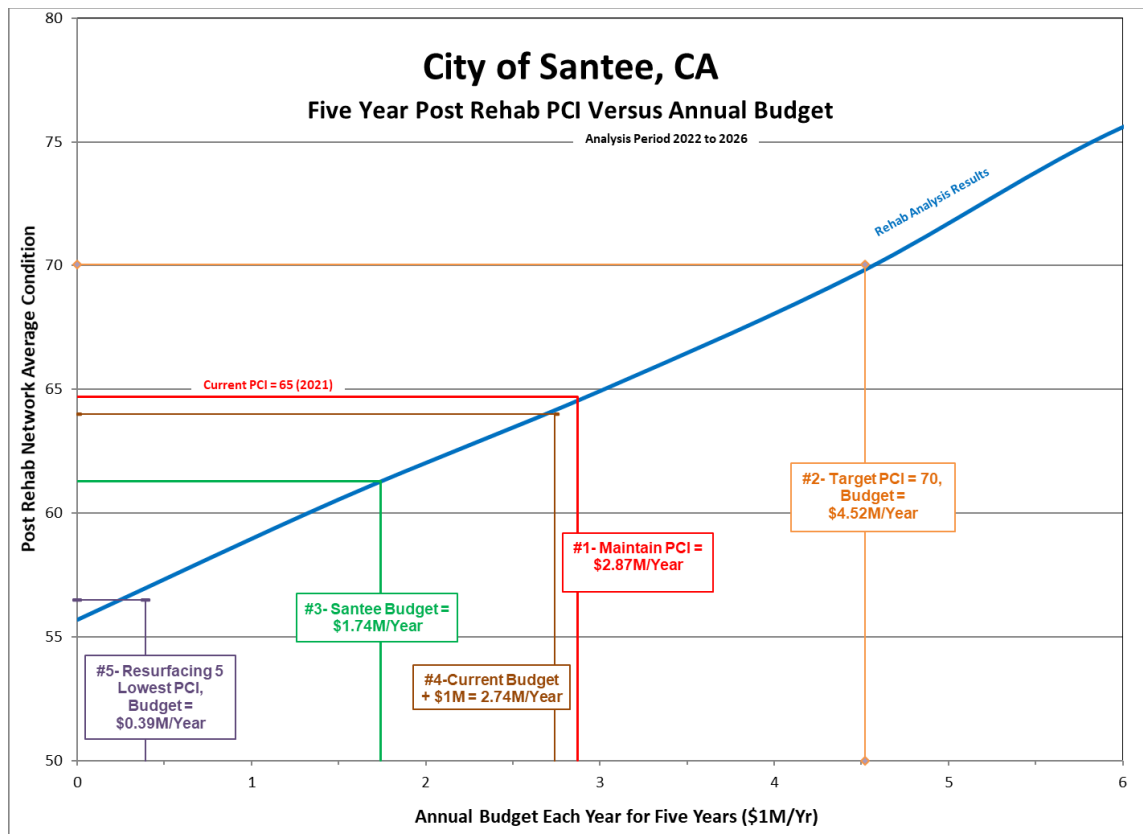

Figure 10 – 5-Year Post Rehab Network PCI Analysis Results

Figure 11 presents the resultant network backlog against annual budget. Similar to **Figure 10**, but instead of plotting the average PCI score, the blue diagonal line represents the total backlog after 5 years.

The lower the backlog the better, with a maximum of 15% recommended.

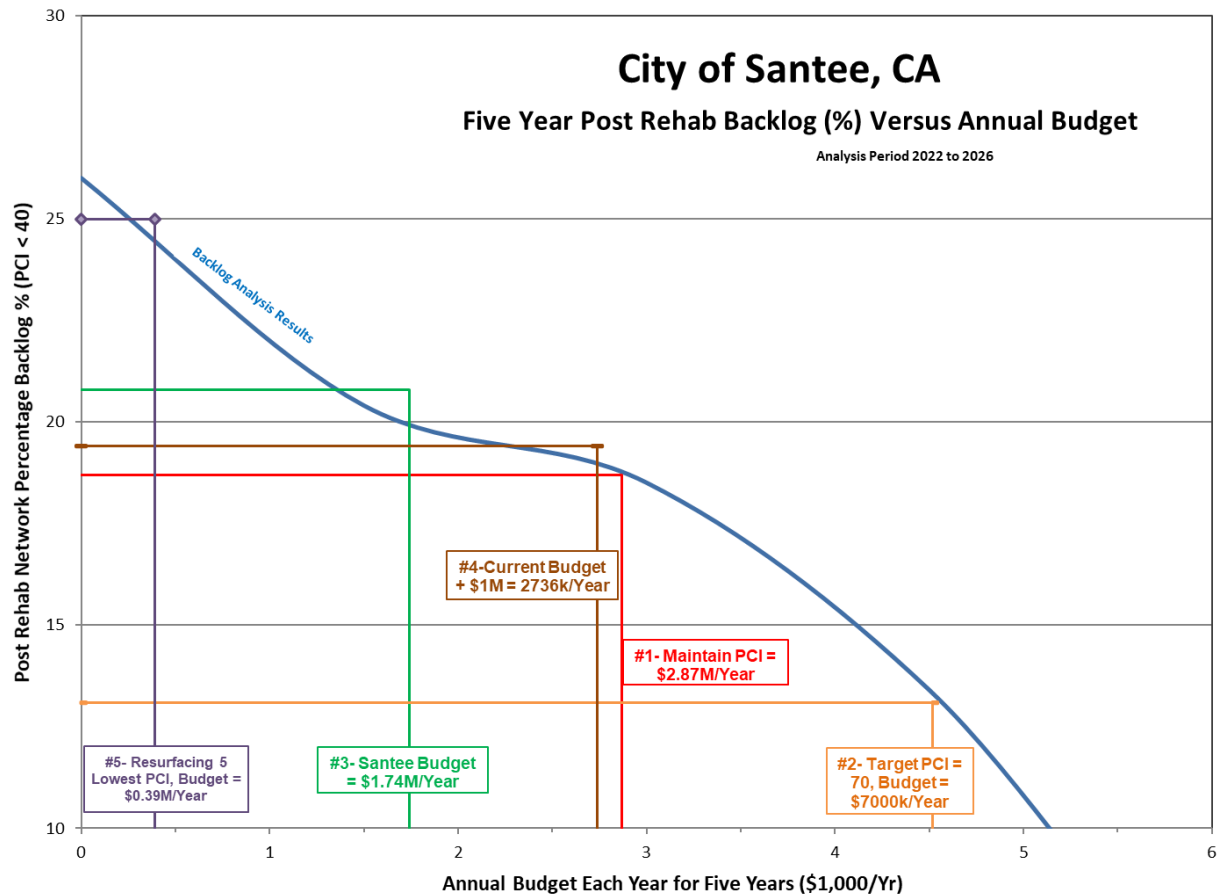

Figure 11 – 5-Year Post Rehab Network Backlog Results

Figure 12 presents the analysis results on an annual basis. This shows that if the budget falls below \$2.87M/yr (Maintain PCI), over time the overall condition of the roads will deteriorate as backlog continues to grow.

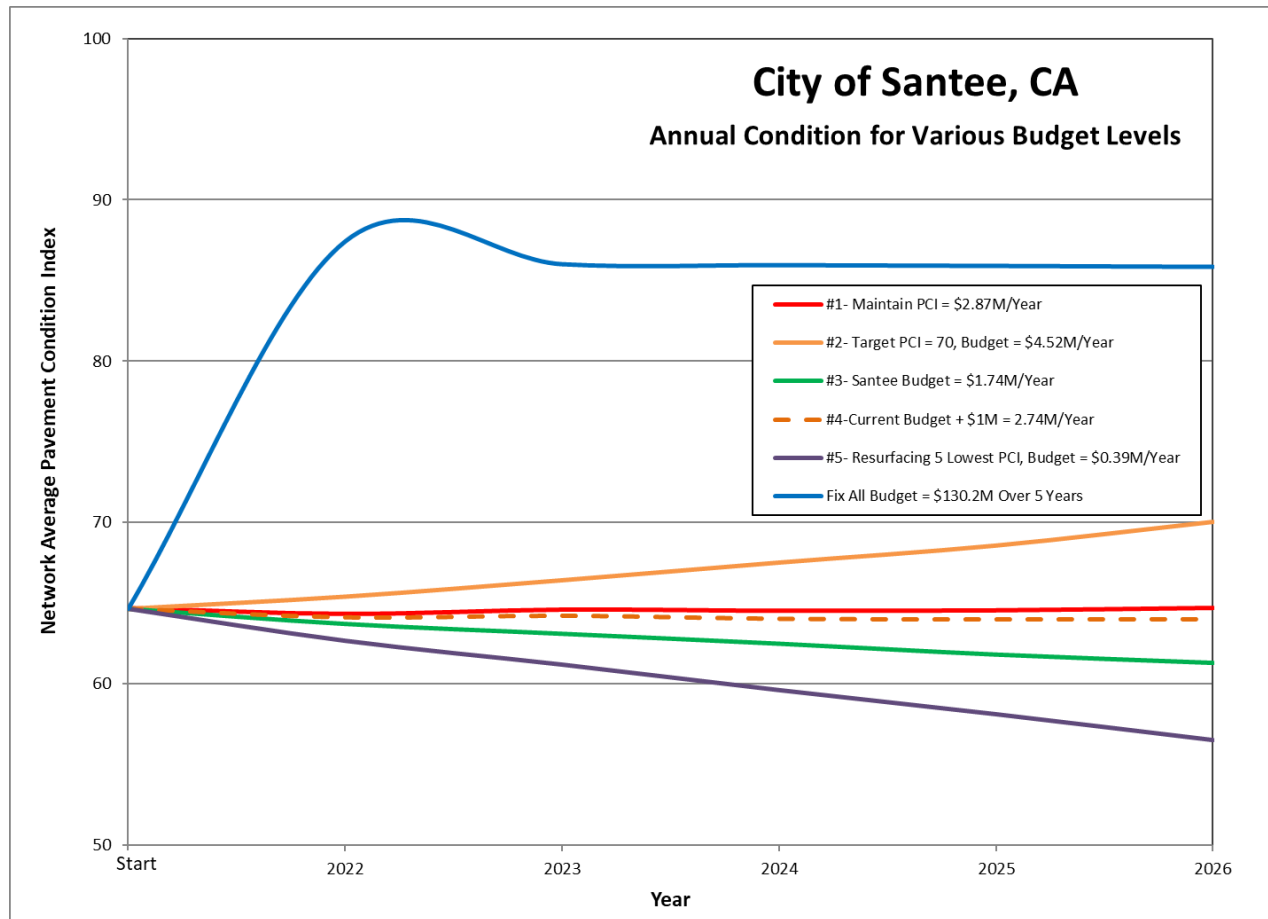

Figure 12 – 5-Year Annual PCI

5.4 Post Rehabilitation Condition

The following figure (**Figure 13**) compares the current network condition distribution (red) against what the 5-year post rehabilitation distribution would be at with the current budget of \$1.74M/yr (blue). With the City's current annual budget dedicated to pavement M&R and previously planned projects, the average PCI is expected to drop to a 61 by the end of the five-year plan and the backlog to increase to 21%.

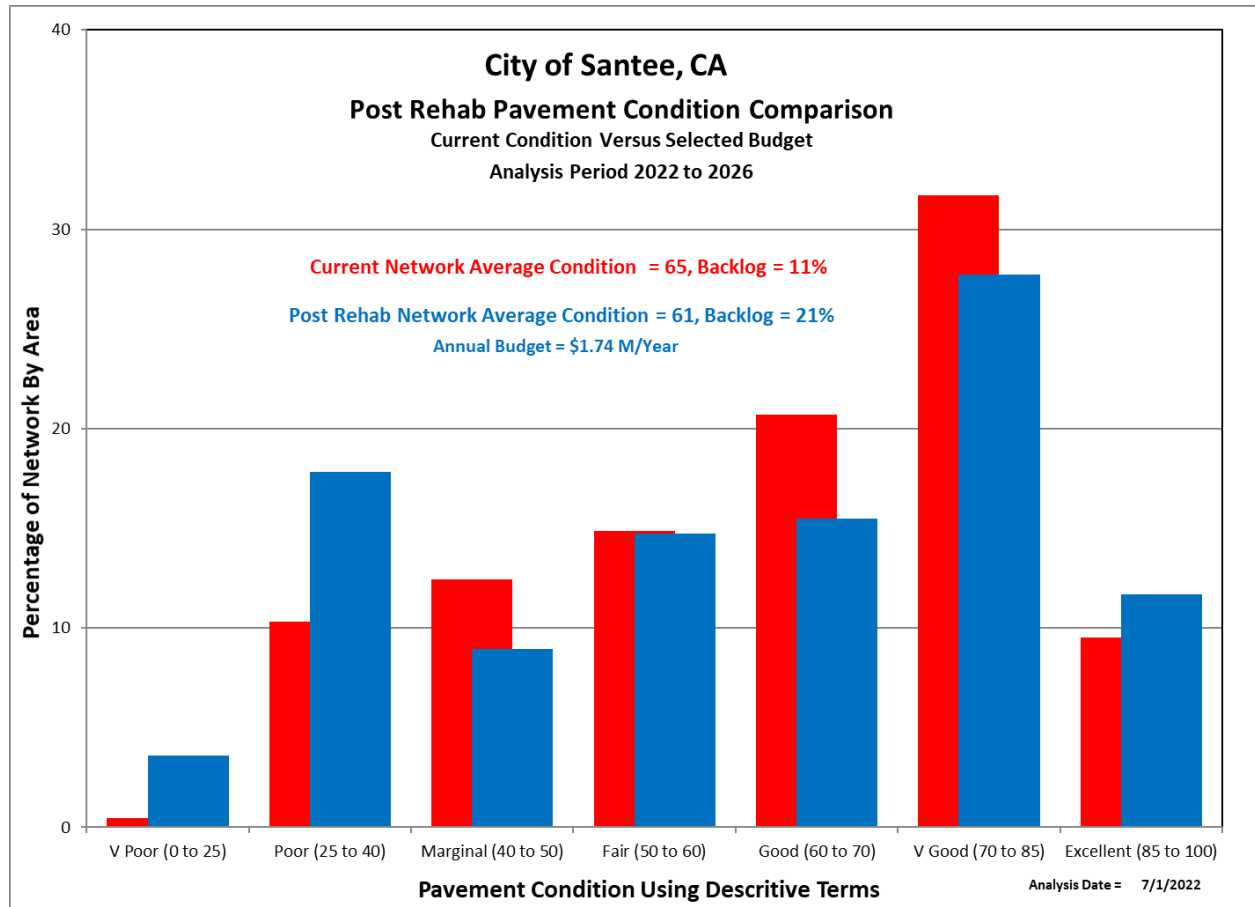

Figure 13 – 5-Year Post Rehabilitation Condition Distribution

Finally, the pavement management program was used to formulate practical projects for the City with its current annual budget of \$1.74M based on the current zone boundaries and input from City staff.

5.5 Summary

Section 5 outlines the operating parameters and inputs used to generate the funding scenarios and budget predictions for the City of Santee. A total of 5 different projects were discussed with the current estimated funding level for the City resulting in a final **PCI of 57** by 2026 and an estimated required funding level of \$2.87M/yr to maintain the current condition at a **PCI of 65**. The previous report recommended a funding level of \$2.48M/yr to maintain the 2017 PCI of 62. Although this level of funding was not achieved the overall condition of the network rose to 65. While a detailed review of the possible reasons for this outcome were not explored as part of this report a high-level review of the previous analysis parameters and the state of some roads that were rehabilitated between surveys does offer some clues. The previous analysis used a rehabilitation plan that would have applied a more costly rehabilitation to some roads than what current city practices call for. Another factor may be in what rehabilitation techniques are used and their cost/longevity. Several roads that had recent chip seals/slurry seals were already showing signs of deterioration, mainly reflective cracking where alligator cracking was present in 2017. This would result in a relatively high PCI increase for a short period of time.

6.0 PAVEMENT MANAGEMENT HISTORICAL DATA

Since the last report prepared in 2017 the City has resurfaced a total of approximately 4,797,719/SF of streets at a total cost of approximately \$6.52M. These costs are the annual CIP resurfacing projects and do not include major street widening projects. Since 2002, approximately \$30.98M has been spent on City funded resurfacing projects.

Of the 506 public streets within the City of Santee's street network, approximately 374 streets have been resurfaced as part of the City's annual resurfacing program since 2002. A total of 89 streets have been resurfaced twice since 2002 and a total of 285 streets have been resurfaced once. A minimum of 14 years has elapsed since the first treatment was applied to those streets receiving a second street treatment. Streets receiving multiple treatments are streets that initially received an overlay, cape or slurry seal and the 2nd treatment was a slurry seal to ensure the street was properly maintained and reduce future maintenance costs. The industry average of the reapplication of slurry seals is 7 years.

Below in **Table 8** and **Table 9** is a summary of the zone resurfacing in Santee. This data was incorporated into the 2022 analysis. A full list of all repaved streets within the City can be found in **Appendix G**.

6.1 Summary of Past PMS Reports

The following data summarizes the recorded PCI values and details about network conditions at the time of the report noted. Variations between conditions can be caused by multiple factors including, but not limited to: survey methodology, size and growth of the network, how and where rehabilitation funds were spent, longevity of rehabilitation techniques, and changes in traffic patterns.

2003 PMS Update

PCI Arterials – 73

PCI Residential – 68

2008 PMS Update

PCI Arterials – 55

PCI Residential – 49

2013 PMS Update

PCI Arterials – 73

PCI Residential – 60

Total amount of paving related projects between the 2008 and 2013 PMS Update was \$5,482,000.

During this period:

Sky Ranch, private developer funded, was added into the City's Street Network.

ARRA funding (\$872,700) was used on 1 pavement repair project.

CDBG Grants (\$590,400) were used on 2 pavement repair projects.

TransNet and Gas Tax Funding (\$4,018,900) were used on 3 pavement repair projects.

2016 PMS Update

PCI Arterials – 58

PCI Residential – 62

Total amount of paving related projects between the 2013 and 2016 PMS Update was \$30,033,800.

During this period:

Buena Vista Avenue and Railroad Avenue (\$4,239,300) was reconstructed utilizing CDBG Grants and Developer Impact Fees.

Prospect Avenue (\$11,933,900) was reconstructed with Redevelopment Agency Funding.

Town Center Parkway Widening (\$281,100) was constructed utilizing Developer Impact Fees.

City utilized the Advanced Funding Bond Issuance Program through SANDAG in which the City borrowed against future TransNet allocations to increase the amount of fund.

TransNet and Gas Tax Funding (\$13,579,500) were used on 11 pavement repair projects.

2017 PMS Update

PCI Arterials – 62

PCI Residential – 62

7.0 PROJECT RECOMMENDATIONS AND COMMENTS

7.1 Project Summary and Recommendations

A pavement condition survey was performed in September 2021 on approximately 126 centerline miles of the Santee network. The results of the condition survey were then input into the ESA pavement management system. This system was used to organize a georeferenced pavement inventory, develop an accurate model of the network's condition and anticipated deterioration, and provide funding recommendations for various level-of-service goals.

For the City to get the most out of their ESA system it must be updated regularly with routinely collected pavement condition data, M&R strategies and unit costs. This report outlines the most recent efforts to update and maintain the Santee pavement management system. Following the pavement management survey, the analysis software was updated with the most recent and accurate condition data, resulting in a **network-wide average PCI of 65**.

The following broad recommendations are presented to Santee as an output from the pavement analysis and must be read in conjunction with the attached reports.

1. Santee should adopt a level-of-service policy statement to maintain PCI at or above a 60 while keeping backlog below 20%.
2. **The current annual budget of \$1.74M (dedicated to pavement resurfacing) will achieve a network average PCI of 59 and backlog of 24% after 5-years.**
3. The full suite of proposed rehabilitation strategies and unit rates should be reviewed annually as these can have considerable effects on the final program.
4. The City should keep track of M&R work performed in the City and update the pavement management system with newly repaired streets.
5. The City should resurvey their streets every 3-5 years to update the condition data and rehabilitation program.

7.2 Closing

The IMS Team greatly appreciates the opportunity to work with the City of Santee on another pavement management update. Over the course of several pavement management projects it has become clear that the City staff demonstrates a good-faith effort to provide the best level-of-service that they can to their community. IMS stands ready to assist the City for training and technical support as necessary, and we welcome the opportunity to work with the City on future pavement management projects.

Independent QC Report

QUALITY MONITORING REPORT

Santee, CA

January 2022

High-definition (HD) images and a GIS shapefile were made available to Quality Engineering Solutions (QES) by IMS Infrastructure Management Services (IMS) on January 5, 2022, while Laser Crack Measurement System (LCMS) images were made available on January 13, 2022. A total of 74 asphalt concrete street segments varying in length from 62 feet to 1,525 feet were selected by QES for review. QES raters used QGIS software to locate and review the pavement segments, while distress types, quantities, and severities, were logged in an excel spreadsheet. Documented in this letter report are the results of the quality monitoring process completed by QES.

Rater Training

Rater training began in January 2022 with a review of the following distress manual:

- ASTM D6433-18 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys

This training was completed by Ryan Finley, Raul Belleza, and Michael Lahnala.

Quality Assurance Check

A quality assurance (QA) check of the IMS ratings was completed as documented in the attached table of QA results. QES reviewed IMS provided HD and LCMS images to determine the pavement distress types, severities, and quantities present on a total of 74 asphalt concrete street segments. Surface Distress Index (SDI) values were calculated for each segment from the QES data and converted into Pavement Condition Indices (PCI) values using the Roughness Index (RI) and Structural Index (SI). Finally, both the IMS provided PCIs and the QES calculated PCIs were compared and segments with PCI differences greater than 5 points were reviewed to determine if a random or systematic error may be present.

A total of 3 out of 74 segments (4.1%) were flagged as having a PCI difference greater than 5 points.

For Carefree Drive (from the west end to Peaceful Drive) and on Carefree Drive (from Peaceful Drive to Woodpark Drive), QES identified alligator cracking in the wheels paths which resulted in a large difference in PCI. Upon closer review and as shown in Figure 1, there appears to be a combination of alligator and block cracking on this segment, whereas IMS rated all longitudinal & transverse cracking. Although previous surveys may have only included longitudinal & transverse cracking or block cracking, it is evident in some areas, the blocks have further deteriorated into alligator cracking. We recommend alligator cracking be including in the ratings on this section.

Figure 1. Carefree Drive, Street Number 1690, Block Number 10

For Lutheran Way (from Ryder Road to Roecrest Drive), QES identified a larger quantity of medium severity alligator cracking than IMS which resulted in a large difference in PCI. We recommend that IMS adjust their reported distress to include a larger quantity of medium severity alligator cracking as demonstrated in Figure 2.

Figure 2. Lutheran Way, Street Number 4050, Block Number 50

Summary

In summary, potential errors appear to be random in nature and only 3 out of 74 segments (4.1%) were identified as necessitating further review. For two segments on Carefree Drive, we recommend IMS include some level of alligator cracking in addition to block cracking. For one segment on Lutheran Way, we recommend IMS review and adjust their distress ratings to include a larger quantity of medium severity alligator cracking.

PCIs based on IMS distress totals for over 95% of the street segments checked were within 5 points of QES calculated PCI values. We believe that this indicates that IMS has provided high quality pavement distress data which will result in valid PCI numbers as well as reasonable pavement management recommendations.
